# *Executive Summary*

The Fish and Wildlife Service has prepared this Comprehensive Conservation Plan to guide the management of Sam. D. Hamilton National Wildlife Refuge in Oktibbeha, Winston, and Noxubee Counties, Mississippi. The plan outlines programs and corresponding resource needs for the next 15 years, as mandated by the National Wildlife Refuge System Improvement Act of 1997.

Before the Service began planning, it conducted a biological review of the refuge's wildlife and habitat management program and conducted public scoping meetings to solicit public opinion of the issues the plan should address. The biological review team was composed of biologists from federal and state agencies and nongovernmental organizations that have an interest in the refuge. The refuge staff held three public scoping meetings and three public meetings to solicit public comment during the 60-day public review and comment period of the draft comprehensive conservation plan and environmental assessment.

The Service developed and analyzed three alternatives.

## Alternative A: No Action (Current Management)

This alternative is referred to as our "No Action" or "Current Management" alternative, as required by the National Environmental Policy Act (NEPA). Under this alternative, no major changes to biological, public use, and administrative management practices would occur from their current levels.

## Alternative B: Focus on Waterfowl and Federally Listed Species

This management scheme places priority on the federally listed species and waterfowl which are integral to the refuge's purpose. This alternative emphasizes active habitat management actions that would benefit the endangered red-cockaded woodpecker and waterfowl. Visitor service programs and facilities in support of the six priority public uses (e.g., hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation) would be much reduced below those levels for Alternatives A and C. Non-wildlife-dependent public uses would be phased out.

## Alternative C: (Preferred Alternative) Focus on Wildlife, Habitat Diversity, and Experiencing Nature

This alternative will manage refuge resources to optimize native wildlife populations and habitats under a balanced and integrated approach not only for federally listed species (RCW) and migratory birds, but also for other native species such as white-tailed deer, wild turkey, Northern bobwhite, paddlefish, and forest breeding birds. This alternative also provides opportunities for the six priority public uses (e.g., hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation) and other wildlife-dependent activities found appropriate and compatible with the purposes for which the refuge was established.

The Service selected Alternative C as its preferred alternative and is reflected in this comprehensive conservation plan. Implementing the preferred alternative will result in habitat management based on historic habitat conditions as guided by law (Improvement Act) and policy (601 FW 3) for the Refuge System. Management will be implemented for the conservation of a diverse bottomland hardwood habitat to benefit migratory birds and resident wildlife. Upland habitats will be maintained within their historic habitat conditions including mimicking the natural fire regime and disturbances needed to benefit migratory birds, red-cockaded woodpeckers, and resident wildlife. A focused effort will be

---

made to prevent, reduce, and eradicate invasive species threatening the biological integrity of the refuge. Monitoring and reconnaissance of a variety of wildlife species, ranging from reptiles and amphibians to butterflies to species of concern, will be used to assess and practice adaptive management. Cooperative projects will be prioritized based on ability to meet management objectives outlined in the CCP, or to meet refuge purpose and conducted with universities and other agencies and individuals to provide biological information to be used in management decision-making. When compatible, the wildlife-dependent recreational opportunities including hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation will be provided, and in some instances enhanced, while achieving the refuge purposes.

---

# *I. Background*

## **INTRODUCTION**

This Comprehensive Conservation Plan (CCP) for Sam D. Hamilton Noxubee National Wildlife Refuge (hereinafter referred to as the Sam D. Hamilton Noxubee NWR (SDHN NWR) or the refuge) was prepared to guide management actions and to provide direction for the refuge. Fish and wildlife conservation will receive first priority in refuge management; wildlife-dependent recreation will be allowed and encouraged as long as it is compatible with, and does not detract from, the mission of the refuge or the purposes for which it was established (602 FW 3, USFWS 2000).

A planning team developed a range of alternatives that best met the goals and objectives of the refuge and that could be implemented within the 15-year planning period. The draft of this plan and associated step down plans was made available to state and federal government agencies, conservation partners, and the general public for review and comment were considered in the development of this comprehensive conservation plan, describing the Fish and Wildlife Service's preferred plan. The comments from each entity are addressed in Appendix D of this document.

## **PURPOSE AND NEED FOR THE CCP**

The purpose of the CCP is to develop a proposed action that best achieves the refuge purpose; attains the vision and goals developed for the refuge; contributes to the National Wildlife Refuge System mission; addresses key problems, issues, and relevant mandates; and, is consistent with sound principles of fish and wildlife management (602 FW 1, USFWS 2000).

Specifically, the plan is needed to:

- Provide a clear statement of the refuge management direction;
- Provide refuge neighbors, visitors, and government officials with an understanding of management actions on and around the refuge;
- Ensure that management actions, including land protection, recreation, and environmental education programs, are consistent with the mandates of the National Wildlife Refuge System; and,
- Provide a basis for the development of budget requests for operations, maintenance, and capital improvement needs.

## **FISH AND WILDLIFE SERVICE**

The Fish and Wildlife Service (Service) traces its roots to 1871 and the establishment of the Commission of Fisheries that conducted research and fish culture. The once-independent commission was renamed the Bureau of Fisheries and placed under the Department of Commerce and Labor in 1903.

The Service also traces its roots to 1886 and the establishment of the Division of Economic Ornithology and Mammalogy in the Department of Agriculture. Research on the relationship of birds and animals to agriculture shifted to the delineation of ranges of plants and animals; consequently, the name was changed to the Division of the Biological Survey in 1896.

---

The Department of Commerce's Bureau of Fisheries was combined with the Department of Agriculture's Bureau of Biological Survey on June 30, 1940. The new combined agency was transferred to the Department of the Interior as the Fish and Wildlife Service, renamed the Bureau of Sport Fisheries and Wildlife in 1956, and permanently designated the Fish and Wildlife Service in 1974.

The mission of the Service is "*working with others, to conserve, protect and enhance fish, wildlife, and plants and their habitats for the continuing benefit of the American people.*" This is accomplished through federal programs relating to migratory birds, endangered species, inter-jurisdictional fish and marine mammals, and inland sport fisheries (142 DM 1.1).

As part of its mission, the Service manages the approximately 150-million-acre National Wildlife Refuge System, which encompasses more than 560 national wildlife refuges, thousands of small wetlands, and other special management areas. It also operates 70 national fish hatcheries, 9 fish health centers, 7 fish technology centers, a historic national fish hatchery, 63 fish and wildlife management offices, and 81 ecological services field stations. The Service enforces federal wildlife laws; administers the Endangered Species Act; manages migratory bird populations; restores nationally significant fisheries; conserves and restores wildlife habitat such as wetlands; and helps foreign governments with their conservation efforts. It also oversees the Federal Aid program, which distributes hundreds of millions of dollars in excise taxes on fishing and hunting equipment to state fish and wildlife agencies.

## **NATIONAL WILDLIFE REFUGE SYSTEM**

The mission of the National Wildlife Refuge System, as defined by the National Wildlife Refuge System Improvement Act of 1997 is:

“...to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.”

The National Wildlife Refuge System Improvement Act of 1997 (Improvement Act) established, for the first time, a clear legislative mission of wildlife conservation for the National Wildlife Refuge System (Refuge System). Actions were initiated in 1997 to comply with the direction of this new legislation, including an effort to complete comprehensive conservation plans for all refuges. These plans, which are completed with full public involvement, help guide the future management of refuges by establishing natural resource, recreation, and environmental education programs. Consistent with the Improvement Act, approved plans will serve as the guidelines for refuge management for a 15-year period following their approval. The Improvement Act states that each refuge shall be managed to:

- Fulfill the mission of the Refuge System;
- Fulfill the individual purposes of each refuge;
- Consider the needs of wildlife first;
- Fulfill requirements of comprehensive conservation plans that are prepared for each unit of the Refuge System;
- Maintain the biological integrity, diversity, and environmental health of the Refuge System;

- 
- Recognize that wildlife-dependent recreation activities, including hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation, are legitimate and priority public uses; and, allow refuge managers authority to determine compatible public uses.

The following are examples of the national network of conservation lands:

Pelican Island National Wildlife Refuge, the first refuge, was established in 1903 for the protection of colonial nesting birds in Florida, such as the snowy egret (*Egretta thula*) and the brown pelican (*Pelecanus occidentalis*).

Western refuges were established for American bison (*Bison bison*) (1906), elk (*Cervus Canadensis*) (1912), prong-horned antelope (*Antilocapra Americana*) (1931), and desert bighorn sheep (*Ovis canadensis nelson*) (1936) after over-hunting, competition with cattle, and natural disasters decimated once-abundant herds.

The drought conditions of the 1930s “Dust Bowl” severely depleted breeding populations of ducks and geese. Refuges established during the Great Depression focused on waterfowl production areas (i.e., protection of prairie wetlands in America’s heartland). The emphasis on waterfowl continued to include protection of wintering habitat and expanded to other migratory birds in response to a dramatic loss of bottomland hardwoods and wetlands.

Wildlife refuges are now home to more than 700 species of birds, 220 species of mammals, 250 reptile and amphibian species and more than 200 species of fish. Only 59, or just over 10 percent, of refuges have been established with a primary purpose of conserving threatened or endangered species and approximately 280 (23 percent) of the 1,200-plus federally listed threatened or endangered species in the United States are found on units of the Refuge System.

The 2011 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation showed that 90.1 million Americans, 38 percent of the United States’ population 16 years and older, participated in wildlife-dependent recreation. The total national expenditures by hunters, anglers, and other wildlife recreationists in 2011 was \$145 billion or 1 percent of gross domestic product (meaning that one out of every 100 dollars of all goods and services produced in the United States is due to wildlife-dependent recreation). In 2011, 13.7 million people hunted, spending \$34 billion with an average of \$2,484 spent per hunter. In 2011, 33.1 million people fished, spending \$41.8 billion with an average of \$1,262 spent per angler. In 2011, 71.8 million people participated in wildlife watching, spending \$55 billion with an average of \$766 spent per participant. Although the survey focuses on people 16 years of age and older who participated in wildlife-dependent recreation, it does include some information for 6- to 15-year olds, showing that in 2011 approximately 11.7 million watched wildlife, 8.5 million fished, and 1.8 million hunted (U.S. Fish and Wildlife Service 2012). According to a Department of the Interior Economic Contributions 2011 report, in 2010 national wildlife refuges generated more than \$3.98 billion in economic activity and created more than 32,000 private sector jobs nationwide (U.S. Department of the Interior 2011).

The economic impacts of the Refuge System continue to grow. Since the 2006 Banking on Nature study, volunteer hours, Refuge System visitation, and associated economic activity have all increased (Carver et al. 2013). Volunteers continue to be a major contributor to the success of the Service. During Fiscal Year 2011, 46,880 volunteers donated more than 1.7 million hours. The value of their labor was more than \$32 million, which is the equivalent of 775 full-time employees. Further, more than 200 Friends organizations also support the work of the Service. Refuge System visitation has grown to over 45.7 million visitors in 2011.

---

## **LEGAL AND POLICY CONTEXT**

### **Legal Mandates, Administrative and Policy Guidelines**

Administration of national wildlife refuges is guided by the mission and goals of the Refuge System, congressional legislation, presidential executive orders, and international treaties. Policies for management options of refuges are further refined by administrative guidelines established by the Secretary of the Interior and by policy guidelines established by the Director of the Fish and Wildlife Service. Select legal summaries of treaties and laws relevant to administration of the Refuge System and management of the Sam D. Hamilton Noxubee NWR are provided in Appendix C.

These treaties, laws, administrative guidelines, and policy guidelines assist the refuge manager in making decisions pertaining to soil, water, air, flora, fauna, and other natural resources; historical and cultural resources; and research and recreation on refuge lands. They also provide a framework for cooperation between the refuge and its partners, such as the Mississippi Department of Wildlife, Fisheries, and Parks (MDWFP), The Nature Conservancy (TNC), Ducks Unlimited (DU), Friends of Noxubee Refuge, Mississippi State University (MSU), USDA Forest Service (USFS), USDA Animal and Health Inspection Service, National Park Service (NPS), Audubon Society, The Wilderness Society (TWS), National Wild Turkey Federation (NWTF), Starkville School District, Quail Forever, Mississippi Band of Choctaws, Jena Band of Choctaws, the Choctaw Nation, the Chickasaw Nation, and private landowners.

### **Other Special Considerations**

The legal provision 16 U.S.C. 668dd-668ee states that lands within Refuge System are closed to the public use unless specifically and legally opened. No refuge use may be allowed unless it is determined to be compatible. A compatible use is one that, in the sound professional judgment of the refuge manager, will not materially interfere with or detract from the fulfillment of the mission of Refuge System or the purposes of the refuge. All programs and uses must be evaluated based on the mandates set forth in the Improvement Act as follows:

- Contribute to ecosystem goals, as well as refuge purposes and goals;
- Conserve, manage, and restore fish, wildlife, and plant resources and their habitats;
- Monitor the trends of fish, wildlife, and plants;
- Manage and ensure appropriate visitor uses as those uses benefit the conservation of fish and wildlife resources and contribute to the enjoyment of the public; and,
- Ensure that visitor activities are compatible with refuge purposes.

The Improvement Act further identifies six priority wildlife-dependent recreational uses. These uses are hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation. As priority public uses on the Refuge System, they receive priority consideration over other public uses in planning and management.

### **Biological Integrity, Diversity, and Environmental Health Policy**

The Improvement Act directs the Service to ensure that the biological integrity, diversity, and environmental health of the Refuge System are maintained for the benefit of present and future generations of Americans. The policy is an additional directive for refuge managers to follow while achieving refuge purpose(s) and the Refuge System mission. It provides for the consideration and protection of the broad spectrum of fish, wildlife, and habitat resources found on refuges and

---

associated ecosystems. When evaluating the appropriate management direction for refuges, managers will use sound professional judgment to determine their refuges' contribution to biological integrity, diversity, and environmental health at multiple landscape scales. Sound professional judgment incorporates field experience, knowledge of refuge resources, the refuge role within an ecosystem, applicable laws, and best available science, including consultation with others both inside and outside the Service (601 FW 3, USFWS 2003).

## NATIONAL AND INTERNATIONAL CONSERVATION PLANS AND INITIATIVES

Multiple partnerships have been developed among government and private entities to address the environmental problems affecting the different regions. There is a large amount of conservation and protection information that defines the role of the refuge at the local, national, international, and ecosystem levels. Conservation initiatives include broad-scale planning and cooperation between affected parties to address declining trends of natural, physical, social, and economic environments. The conservation guidance described below, along with issues, problems, and trends, was reviewed and integrated where appropriate into this CCP.

This CCP supports, among others, the Partners-in-Flight Plan, the North American Waterfowl Management Plan, the Western Hemisphere Shorebird Reserve Network, and the National Wetlands Priority Conservation Plan.

Conservation priorities for national wildlife refuges in the Central Gulf Ecosystem focus on threatened and endangered species, species for which the Service has statutory responsibility (trust species), and species of local concern. The goals and objectives in this CCP are stepped down from the following plans:

### North American Waterfowl Management Plan (USFWS 2012)

The North American Waterfowl Management Plan established a broad set of goals to stabilize or increase waterfowl to average fall flight populations of the 1970s. Under the direction of the plan, priority habitat areas were established to facilitate these goals. Sam D. Hamilton Noxubee NWR is not located in one of these targeted areas. However, the refuge contributes directly to the protection and enhancement of resident migrating and wintering waterfowl habitat, which is a key goal under the plan.

### Partners in Flight North American Landbird Conservation Plan (PIF 2004)

The North American Landbird Conservation Plan provides a continental synthesis of priorities and objectives that will guide landbird conservation actions at national and international scales. At the refuge level, habitats that support conservation of high-priority neotropical migratory birds can be incorporated into these conservation actions. Examples of PIF's priority migratory birds on the refuge include wood thrush (*Hylocichla mustelina*) in the mixed pine/hardwood habitats and rusty blackbirds (*Euphagus carolinus*) overwintering in the bottomland hardwoods ([http://www.blm.gov/wildlife/pl\\_04sum.htm](http://www.blm.gov/wildlife/pl_04sum.htm)).

---

### North American Bird Conservation Initiative (NABCI)

The U.S. North American Bird Conservation Initiative (NABCI) Committee is a forum of government agencies, private organizations, and bird initiatives helping partners across the continent meet their common bird conservation objectives. The Committee is working to secure a bright future for North America's more than 1,150 species of birds, in conjunction with NABCI partners in Mexico and Canada. The refuge works under the direction of the Service leadership on the committee to further bird conservation. In particular, the refuge participates in a number of national surveys and monitoring activities to facilitate integrated bird conservation (<http://www.nabci-us.org/plans.htm>).

### United States Shorebird Conservation Plan (Brown et al. 2001)

The foundation for shorebird conservation in the United States is guided by this plan and establishes prioritization of habitat needs to support this initiative. Regional plans have subsequently been developed to identify which species should receive special consideration in those regions and where habitat can or could be managed to support conservation. Given that Sam D. Hamilton Noxubee NWR is an interior, predominantly forested landscape, little habitat is readily available to support regional shorebird efforts along the coastal plain. However, the refuge does intermittently provide shallow water and mudflat areas in spring and summer that are utilized by migratory shorebirds.

### Southeast United States Regional Waterbird Conservation Plan (Hunter et al. 2006)

This regional planning document is a step-down from the North American Waterbird Conservation Initiative. It attempts to place additional conservation measures on waterbirds excluded from the North American Waterfowl Management Plan and the U.S. Shorebird Conservation Plan. Within the Southeast, management is concerned with many waterbirds. Wood storks are a common summer resident; little blue herons and white ibis breed within rookeries on Bluff Lake. The 2012 refuge roost count recorded 22,119 cattle egrets, 747 little blue herons, 287 great egrets, 147 great blue herons, and 241 white ibis. Excessive population levels of double-crested cormorants (*Phalacrocorax auritus*) and cattle egrets (*Bubulcus ibis*) is of concern. Cormorants typically are winter residents that utilize the refuge's lakes for food and roosting habitat.

### Northern Bobwhite Conservation Initiative (NBCI) (Palmer et al. 2011)

The NBCI has a primary goal to reverse the decline in northern bobwhite (*Colinus virginianus*) numbers with emphasis on lands with improvable acres. Within the Southeastern bird conservation region (BCR 27), most of the initiative is placed on agricultural land conversion and improvement in pine plantations to favor grasses and forbs. This non-migratory gamebird is found throughout much of the refuge in areas managed to support the endangered red-cockaded woodpecker (*Picoides borealis*), as well as other areas. Northern bobwhite quail have been shown to respond positively to management for red-cockaded woodpeckers on the refuge, which supports NBCI recovery goals (Fuller 1974).

### East Gulf Coastal Plain Joint Venture (EGCPJV) Plan (EGCPJV 2008)

The EGCPJV Plan is a partnership of various agencies with a mission of protecting and restoring bird populations of the EGCP. Within the plan, key species and habitats have been prioritized based on population declines. The plan establishes a framework to implement bird

---

conservation through habitat management and restoration. Many of the species identified are representative of other major initiatives (Partners in Flight, North American Waterfowl Plan) for which the refuge can play a role in conservation. The refuge provides significant habitat in support of these major initiatives. The plan supports an open pine habitat which is beneficial to Bachman's sparrow and other similar guild species.

Red-cockaded Woodpecker Recovery Plan (USFWS 2003)

The Red-cockaded Woodpecker Recovery Plan provides the framework for the recovery of the red-cockaded woodpecker based on population sizes, habitat condition, and geographic distribution of the species. All federal agencies are charged with recovery actions under Section 7 of the Endangered Species Act. Within the Red-cockaded Woodpecker Recovery Plan, the refuge has been identified as a support population. Though not essential to recovery of the species, the existence of smaller populations distributed across the ecological range of the bird is important.

Wood Stork Recovery Plan (USFWS 1996)

This plan establishes recovery criteria for the North American breeding population of wood storks found in Alabama, Florida, Georgia, and South Carolina. The delisting of the species is primarily based on the number of breeding colonies and average productivity over a 5-year period. Though no stork breeding occurs in Mississippi, the refuge serves as an important location for a portion of the population to summer. The refuge provides roosting and foraging habitat for these birds throughout the summer months through water level fluctuation (either natural or human manipulated) in the refuge's lakes, wetlands, streams, and ditches.

Lower Mississippi Alluvial Valley Joint Venture "Restoration, Management, and Monitoring of Forest Resources in the Mississippi Alluvial Valley: Recommendations for Enhancing Wildlife (LMVJV 2007)

The Lower Mississippi Alluvial Valley Joint Venture worked with partners to define recommendations for desired forest conditions in bottomland hardwood forests. The Desired Forest Conditions (DFC) is an outline designed to provide suitable habitat for foraging and cover within all dimensions of the forest and provide a desirable blend of regeneration, maturity, and senescence of forest trees that will address the habitat needs of priority wildlife species, with an emphasis on migratory birds.

Strategic Habitat Conservation – Gulf Coastal Plains and Ozark Landscape Conservation Cooperative (USFWS 2006)(GCPO 2013)

Landscape Conservation Cooperatives (LCCs) are applied conservation science partnerships focused on a defined geographic area which study on-the-ground strategic conservation efforts at landscape scales. LCCs will enable resource management agencies and organizations to collaborate in an integrated fashion within and across landscapes. LCCs will engage in biological planning, conservation design, inventorying and monitoring program design, and other types of conservation-based scientific research, planning, and coordination. As such, the refuge will work within the context of the defined LCC to support conservation efforts that meet the purpose of the refuge and mission of the Service (USFWS 2010b).

---

### Mississippi Comprehensive Wildlife Conservation Strategy (CWCS) (MS CWCS 2005)

Congress mandated that all 50 states develop Comprehensive Wildlife Conservation Strategies as a condition for receiving state wildlife grant funds. Congress, as part of the State Wildlife Grants program and Wildlife Conservation and Restoration program, identified eight required elements. These elements include: distributions and abundance of wildlife species; locations and conditions of key habitats; identification of problems for wildlife/habitats; strategies for conserving wildlife/habitats; monitoring, review, and coordination with partners; and public participation. The Mississippi CWCS was developed in compliance with this congressional mandate and serves as Mississippi's blueprint for fish and wildlife conservation statewide for the next half century. The plan is a broad set of conservation strategies for wildlife and fish species and their key habitats in greatest need of conservation which are managed by the State of Mississippi. The State of Mississippi also identifies species of greatest conservation need associated with each habitat.

### The North American Wild Turkey Management Plan (National Wild Turkey Federation 2010)

The North American Wild Turkey Management Plan is a compilation of regional, state, and provincial plans that will outline goals to help wildlife management agencies and the National Wild Turkey Federation's dedicated volunteers target the most important factors in wild turkey (*Meleagris gallopavo*) conservation and protect our hunting heritage. In support of the North American Wild Turkey Management Plan and the continued efforts of wild turkey conservation and the preservation of the hunting tradition, the National Wild Turkey Federation's Mississippi State Chapter and its members have spent more than \$1.8 million in Mississippi since 1985. The money has been raised through hunting heritage banquets and administered jointly by the National Wild Turkey Federation, its state chapters and state wildlife agencies. The Mississippi State Chapter's priorities fall into five categories: Habitat Enhancement, Hunter Access, Wild Turkey Research, Education, and Outreach. The Mississippi State Chapter has awarded the refuge a Super Fund Project of \$25,000 over 5 years to enhance wild turkey habitat with prescribed burning, herbicide, and field restoration. This project will benefit wild turkey and Northern bobwhite by creating useful foraging/brooding areas. These treatments would also be beneficial for many other species of interest, including the endangered red-cockaded woodpeckers, Bachman's sparrows, and brown-headed nuthatches.

## **RELATIONSHIP TO STATE WILDLIFE AGENCY**

A provision of the National Wildlife Refuge System Administration Act of 1966, and subsequent agency policy, is that the Service shall ensure timely and effective cooperation and collaboration with state fish and wildlife agencies during the course of acquiring and managing refuges. State wildlife management areas and refuges provide foundations for protection and contribute to the overall health and sustainment of fish and wildlife species in Mississippi.

---

The Mississippi Department of Wildlife, Fisheries, and Parks is a state-partnering agency with the Service, charged with enforcement responsibilities for migratory birds and endangered species, as well as managing state natural resources. The mission of the MDWFP is to conserve and enhance Mississippi's natural resources, to provide continuing outdoor recreational opportunities, to maintain the ecological integrity and aesthetic quality of the resources, and to ensure socioeconomic and educational opportunities for present and future generations. The state's participation and contribution throughout the comprehensive conservation planning process has provided for ongoing opportunities and open dialogue to improve the ecological integrity of fish and wildlife in Mississippi. For more information see website <http://www.mdwfp.com>. The MDWFP manages approximately 51 wildlife management agencies, 20 fishing lakes, and 25 state parks located throughout the state.

---

## ***II. Refuge Overview***

### **INTRODUCTION**

National wildlife refuges provide an important support role in conserving threatened and endangered species and native habitats for many resident and migratory wildlife species, including mammals, birds, fish, amphibians, reptiles, and insects. In addition, refuges offer a wide variety of wildlife-dependent recreational opportunities, and many have visitor centers, wildlife trails, and environmental education programs.

This chapter provides an overview of the history and purposes of the refuge, its role within the ecosystem, and its recognized ecological threats and problems. This chapter describes the refuge's physical, biological, and cultural resources, and discusses the socioeconomic context, the administration, and management of the refuge.

### **REFUGE HISTORY AND PURPOSE**

Sam D. Hamilton Noxubee NWR is located within three counties (Noxubee, Oktibbeha, and Winston) in east-central Mississippi, and is approximately 17 miles south-southwest of Starkville and approximately 120 miles north-northeast of Jackson, the capital city of Mississippi (Figure 1). There are four major access routes to the refuge: Oktoc Road from Starkville; Highway 25 by way of Loakfoma Road; the Brooksville-Louisville Road from Louisville; and, Lynn Creek Road from Brookville (Figure 2).

#### **Refuge Purpose**

The primary establishing legislation for the refuge is Executive Order 8444, dated June 14, 1940, with the stated purpose, "...as a refuge and breeding ground for migratory birds and other wildlife..." 16 U.S.C., 715 (Migratory Bird Conservation Act of 1929). Additional purposes under which lands are managed include:

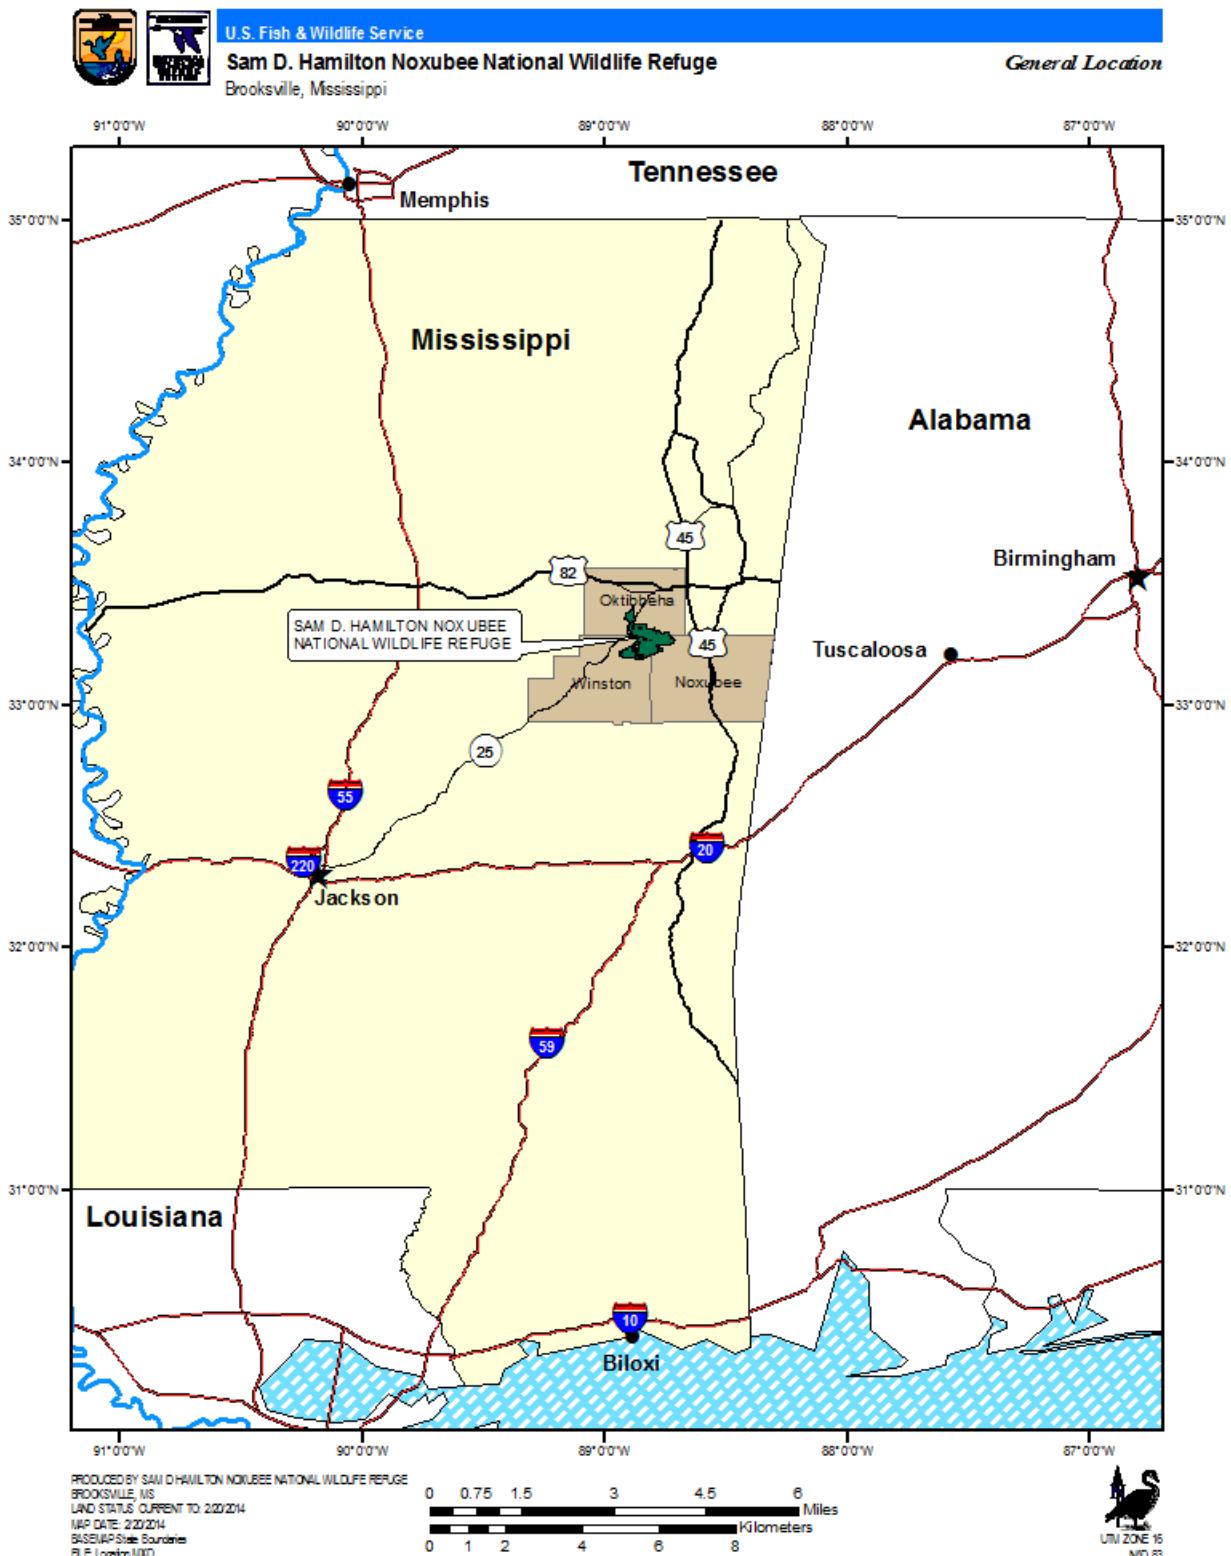

"...for use as an inviolate sanctuary, or for any other management purpose, for migratory birds." (16 U.S.C., 715d Migratory Bird Conservation Act of 1929)

"...for the benefit of the United States Fish and Wildlife Service, in performing its activities and services. Such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude...." (16 U.S.C., 742f(b)(1)); (Fish and Wildlife Act of 1956).

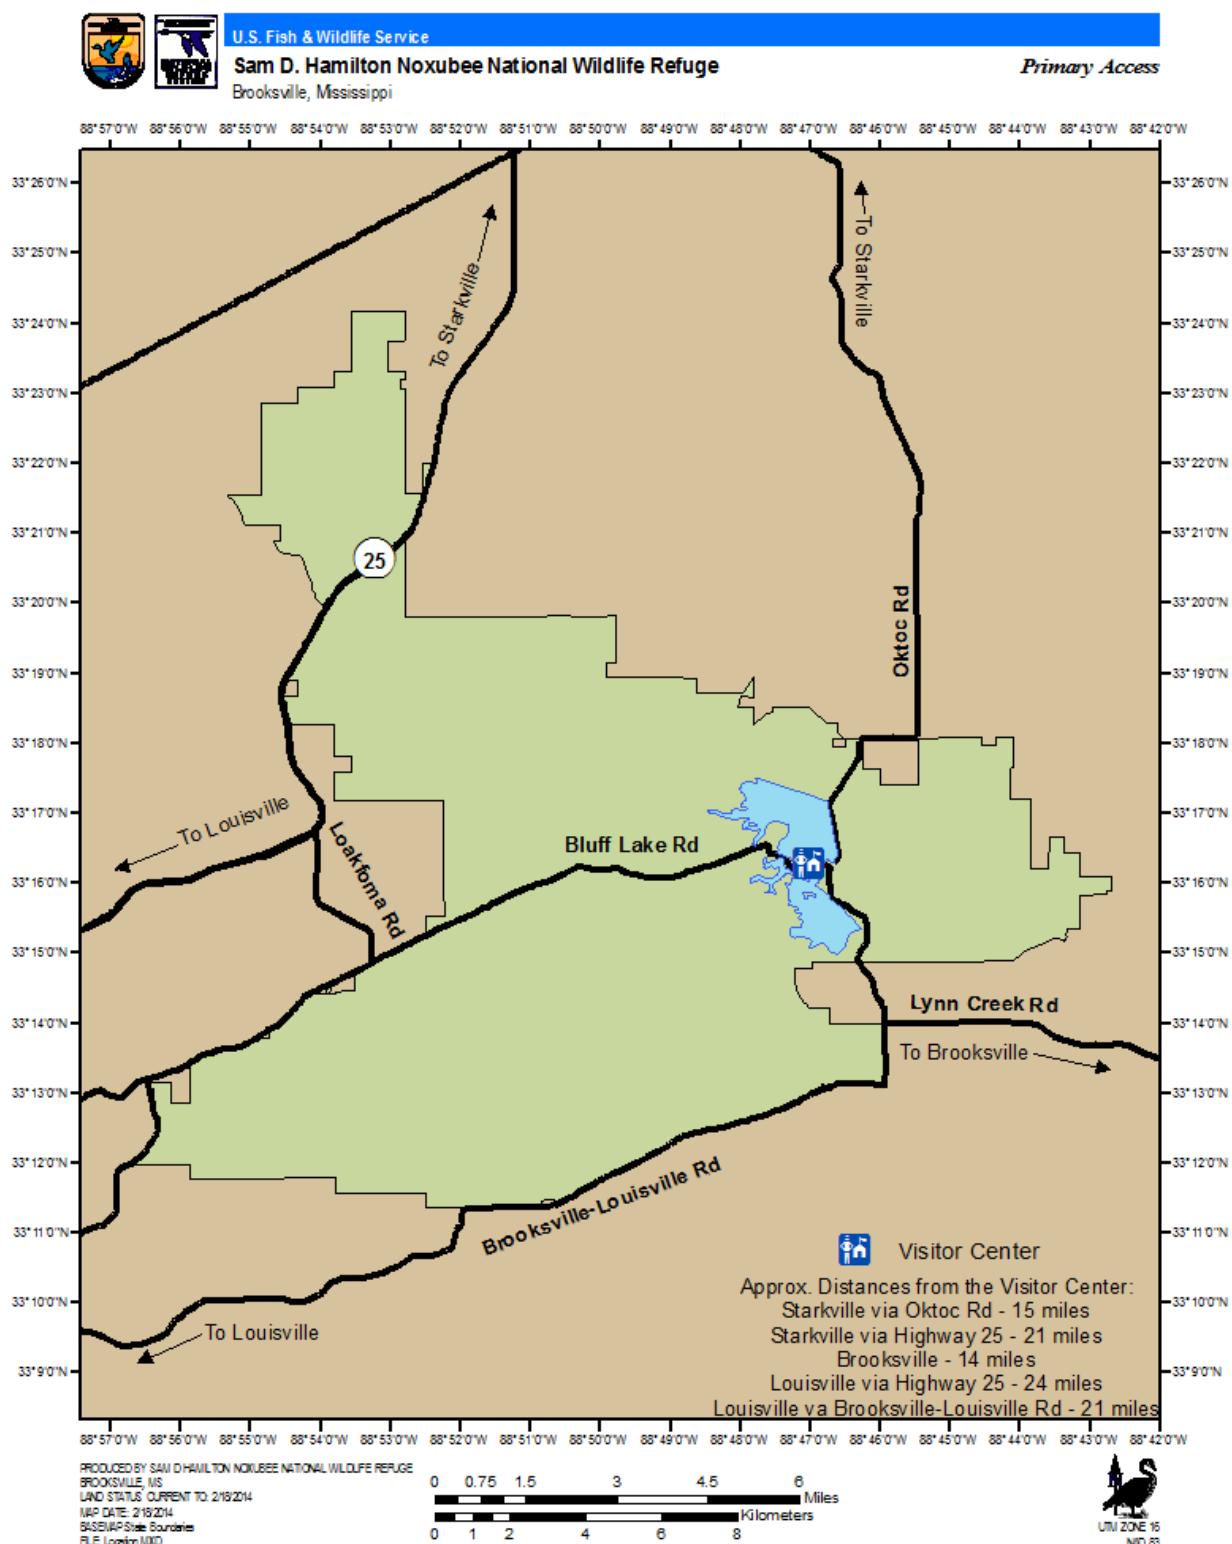

"...conservation, management, and restoration of the fish, wildlife, and plant resources and their habitats for the benefit of present and future generations of Americans." (16 U.S.C., 668dd (a)(2)); (National Wildlife Refuge System Administration Act of 1966)

"...for the development, advancement, management, conservation, and protection of fish and wildlife resources...." (16 U.S.C., 742f(a)(4)).

In accordance with Service policy (610 FW 4.23) the refuge is also tasked with management of the proposed wilderness (Wilderness Review, Appendix H) to achieve the purposes of the Wilderness Act of 1964 (Public Law 88-577).

---

## Refuge History

Established as Noxubee NWR on June 14, 1940, the refuge was subsequently renamed Sam D. Hamilton Noxubee NWR by Public Law 112-279 on February 14, 2012. Prior to 1830 and settlement by early Euro-Americans, northeastern Mississippi was inhabited by several Native American tribes. By the sixteenth century (1700s), these Native Americans had impacted the region's extensive forests, savannas, and streams through the use of fire. These indigenous people used fire to enhance their food supplies through modification of forest composition and creation of grasslands and agricultural fields. These mound-building people also used fire as a hunting tool, as a symbolic part of ceremonies, and as part of their agriculture practices (i.e., growing corn, beans, and squash) near their settlements. These settlements periodically moved as the soil fertility declined and new agricultural areas were sought.

In 1798, the United States Congress created the Mississippi Territory. In 1830, the Choctaw Nation signed the Treaty of Dancing Rabbit Creek, relinquishing all claims to land in Oktibbeha, Noxubee, and Winston counties Mississippi, allowing for Euro-American settlement of the area. Past refuge archaeological investigations have uncovered a variety of cultural resources, ranging from early Native-American relics to old homesteads. The earliest known documented site is a Paleo site located by Dr. Janet Rafferty, Mississippi State University. The site near Oktoc Creek produced artifacts dating back to the early archaic period (ca.9000-7000 B.C.). Other investigations have revealed numerous Native-American sites occurring throughout the refuge, producing artifacts such as ceramic shards, projectile points, drill bits, hammer stones, and fire-cracked rocks. These sites are protected under the authority of the Archeological Resources Protection Act of 1979.

At the time of the Treaty of Dancing Rabbit Creek and prior to large scale settlement by Euro-Americans, the East Gulf Coast Plain (EGCP) ecoregion was covered with upland pine, mixed pine-hardwood, upland hardwood, and bottomland hardwood forests, cane breaks, grasslands, and prairies which created a diverse complex ecosystem. Depending on the frequency of fire, the upland forests were either hardwood forests or a mixture of both hardwoods and pines. Upland pine forests had a combination of loblolly (*Pinus taeda*) and shortleaf (*Pinus echinata*), along with individual longleaf (*Pinus palustris*) pines in the overstory and these areas were likely burned every one to two years. In areas frequently burned, the ground cover was open park-like grasses. The more hilly regions within the central and northern portions of the EGCP were predominately hardwoods with shortleaf pine on the ridges (Fickle 2001). A recent study (Fotinos and Ertel 2013) used actual tree data recorded within General Land Office (GLO) records from 1830 to verify the LANDFIRE model of the historic forest conditions (LANDFIRE 2008) of the refuge. Witness trees and surveyor's notes were analyzed and it was determined for those species that could be analyzed that historical upland forests were dominated by post oak (*Quercus stellata*), pine (*Pinus* spp.), hickory (*Carya* spp.), and red and white oaks (*Quercus* spp.). Surveyor's notes provided an additional unique glimpse of early habitat conditions and listed much of the survey area as being open woods, predominantly associated with higher elevations and upland slopes. Lower areas and stream channels were described as having thick understory with "bushes," "briers," and "canes" (Schauwecker et al. 2011). The bottomland forests were described as comprising of various hardwoods such as: red and white oaks, sweetgum (*Liquidambar styraciflua*), American bald cypress (*Taxodium distichum*), sugarberry (*Celtis laevigata*), red maple (*Acer rubrum*), hickories, American sycamore (*Platanus occidentalis*), boxelder (*Acer negundo*), elm (*Ulmus* spp.) and ash (*Fraxinus* spp.). It also included small pockets of loblolly pine and shortleaf pine mixed with post oak, hickory, and white oak (*Quercus alba*). Openings created by fire, winds, beaver (*Castor canadensis*), or other natural events were scattered across the landscape (Fickle 2001). Figure 3 depicts historic forest conditions found in the LANDFIRE model and the report produced by Fotinos and Ertel (2013) in the appendix of this document.

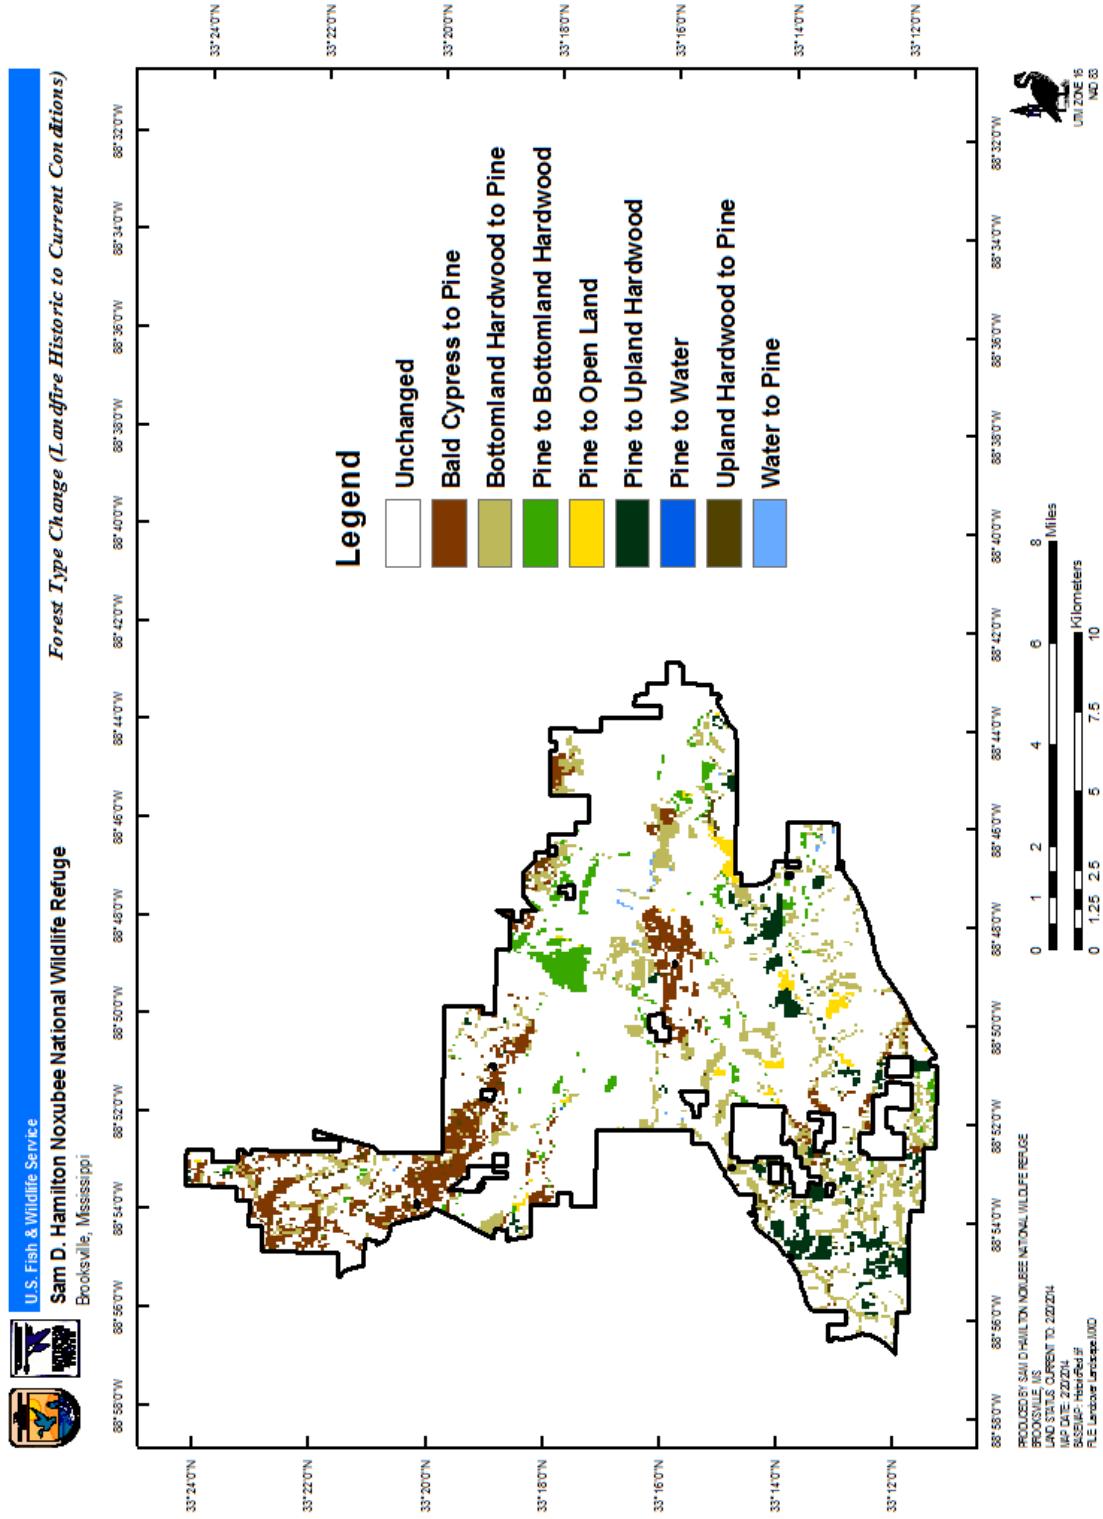

**Figure 3. Sam D. Hamilton Noxubee NWR, Mississippi, LANDFIRE (2008) Historic Forest Type**

---

Starting in 1830, agricultural development proceeded at a rapid pace. Pioneer farmers devoted a great deal of time, money, and energy to clearing land for cultivation. They removed a large amount of the forests for agriculture. Additionally, farming practices were locally intense and had long-term impacts on the land through soil depletion and erosion. Following the depletion of the land's fertility, the farmers and associated families abandoned the land or were no longer able to afford to hold the properties. Farmers and their families moved to more fertile forested areas and began the process again. By the 1930s, the swift settlement and intense farming practices were creating a landscape depleted of top soil and suffering from high erosion (Hickman 1962).

Evidence of early Euro-American settlements is also abundant on today's refuge, including remnants of roads, cemeteries, churches, schools, mill sites, cisterns, a WWII practice bombing range, and one diversion canal dating back to the late 1800s and early 1900s. Dating from 1821, Old Robinson Road was the original public highway from Jackson to Columbus, Mississippi. The road traverses the refuge from the current Bluff Lake Road northeasterly to the south end of the levee on greentree reservoir (GTR) 4 and leaves the refuge by crossing the Noxubee River and bisecting the proposed wilderness area. Old Robinson Road was built by Raymond Robinson to serve as a major route between Columbus and Jackson, Mississippi. The road was listed in the National Register of Historic Places in 1975. The Service's management policy is to protect the 16-foot-wide historic right-of-way. Much like other areas settled since 1830, the land area within the present refuge boundary was intensively farmed and over-grazed by cattle. Figure 4 depicts the forest type change from historic (LANDFIRE 2008) to current conditions. By 1936, the Rural Resettlement Administration through Title II of the National Industrial Recovery Act (NIRA) (1933), Emergency Appropriation Act of (1935) and Title III of the Bankhead-Jones Farm Tenant Act (1937) acquired much of the lands that would later become the refuge. When the resettlement administration acquired more than 100,000 acres of which over 40,000 acres would become the refuge, 25 percent was open fields with 75 percent reverting back to woodland. The Civil Conservation Corps (CCC) built Bluff Lake prior to establishment of the refuge. Along with the formation of the Service in 1940, Noxubee NWR was established by Executive Order 8444 on June 14, 1940. This order reserved lands acquired by the Rural Resettlement Administration as a refuge and breeding ground for migratory birds and other wildlife. On January 27, 1944, Public Land Order 205 transferred lands to the Department of the Interior that had been reserved by Executive Order 8444. Public Land Order 401 (August 19, 1947) enlarged and modified the refuge's boundary.

**Figure 4. Forest type change from 1830 to 2012, Sam D. Hamilton Noxubee NWR, Mississippi**

---

The refuge's initial restoration goals were to rehabilitate the land and create more wildlife habitat through reforestation to reduce soil erosion. From the time of establishment until the early 1950s, the refuge planted thousands of acres in loblolly pine and reintroduce native wildlife to the landscape. Further alterations of the land, including the construction of erosion control structures, Bluff Lake, Loakfoma Lake, levees and water control structures, and four GTRs.

Roads and bridges were created and streams altered due to new construction. The new lakes, water control structures, and altered streams provided over 2,500 acres of habitat for migratory waterfowl, as well as creating aquatic habitats for fish. The forested areas provided new wildlife habitat. Over the years, the refuge has been restocked with numerous native wildlife species. Documented stocked species include white-tailed deer (*Odocoileus virginianus*), beaver (*Castor canadensis*), Canada geese (*Branta canadensis*), and American alligator (*Alligator mississippiensis*).

The National Wildlife Refuge System Administration Act of 1966 provides for the acquisition of land or interests in land in exchange for the right to remove products from acquired or public lands on refuges. Funds generated by a refuge through wildlife habitat management or other sources can be used, if approved by the Director of the Fish and Wildlife Service, for a product-for-land exchange. In the years following establishment, land-for-timber exchange has been the predominant source for acquiring lands from willing sellers. Since the initial acquisitions, most land acquired by the refuge has been by exchange, under the authority of Title III of the Bankhead-Jones Farm Tenant Act. A smaller amount of land has been acquired by purchase, under the authority of the Migratory Bird Conservation Act of 1929 (45 Stat. 1222). Currently, the refuge owns 48,219 acres within the 61,715-acre approved acquisition boundary, leaving 13,496 acres in other ownerships. The current unacquired inholdings include 3,437 acres of state land (640 acres - Section 16 properties; 2,797 acres - Mississippi State University), which will likely never be acquired. The remaining 7,262 acres consists of scattered, small privately owned tracts. The refuge also oversees nine Farm Service Agency Conservation Easements scattered throughout the surrounding counties.

Additional acquisition of land within the approved acquisition boundary of the refuge could possibly come from the Land and Water Conservation Fund, the Migratory Bird Conservation Fund, and U.S. Army Corps of Engineers mitigation programs. New lands can also be acquired through donations from conservation and private organizations or individuals. In addition to acquisitions, conservation easements and leases potentially could be used to obtain the minimum interests necessary to satisfy refuge objectives for the benefit of wildlife. The Service works with interested organizations to identify additional areas needing protection and provides technical assistance, if needed.

## **SPECIAL DESIGNATIONS**

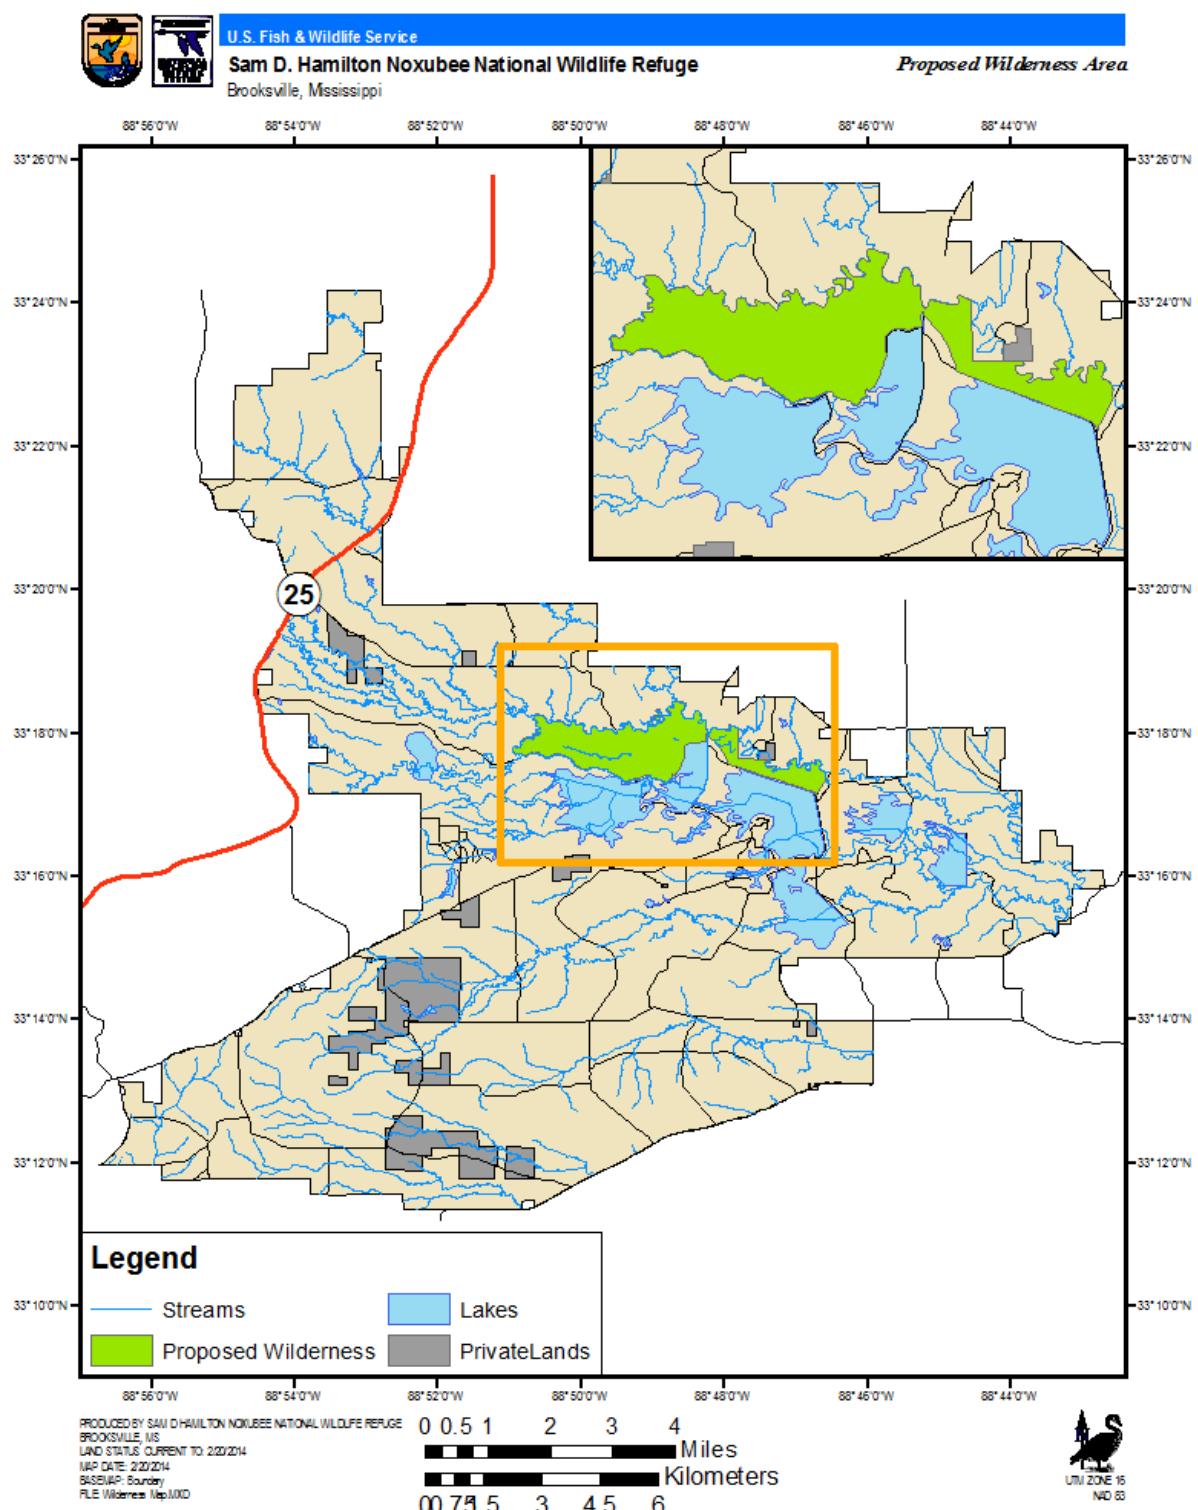

### *Proposed Wilderness Area*

The Wilderness Act of 1964 (Public Law 88-577) required that the Secretary of the Interior review every roadless area of 5,000 acres or more and every roadless island, regardless of size, within the Refuge System and report recommendations to the President as to the suitability or non-suitability of such areas for preservation as wilderness. The President was then to forward recommendations for wilderness to Congress.

In December 1974, a wilderness review was completed, resulting in a 1,200-acre proposed wilderness within the National Wilderness Preservation System at the refuge (Figure 5). The wilderness proposal (Appendix H) was transmitted to Congress on December 4, 1974. However, Congress has yet to act on the wilderness proposal. The proposed wilderness is bounded by the Noxubee River on the west and north, Oktoc Creek on the south, Bluff Lake on the southeast, and

---

Bluff Lake Road on the east. Service policy requires that areas outside Alaska, pending congressional action, be managed to preserve the wilderness resource. The proposed wilderness at the refuge is managed under guidance found in the Service Manual (610 FW1-5), Wilderness Area Management.

**Figure 5. Proposed Wilderness Area 1974, Sam D. Hamilton Noxubee NWR, Mississippi**

---

### *Areas of Special Consideration*

Another type of area of special consideration recognized previously by the refuge has existed but with no strategy or plan developed for these five small areas. One area, Pete's Slough, contains about 150 acres; the other four are relatively small (5-10 acres each). The boundaries to these areas were never officially defined.

### *Research Natural Areas*

The Service administratively designated "Research Natural Areas" (RNAs) on refuges across the United States and its territories. Before discontinuing the program, there were 210 such areas on national wildlife refuges, totaling 1,955,762 acres. RNAs were part of a national network of reserved areas under various ownerships. RNAs were intended to represent the full array of North American ecosystems with their biological communities, habitats, natural phenomena, and geological and hydrological formations. As in designated wilderness, natural processes were allowed to predominate without human intervention. Under certain circumstances, deliberate manipulation could be used to maintain the unique features for which the RNA was established.

Currently, the refuge has two areas established by the Society of American Foresters (SAF) as RNAs. The "Old Robinson Road Research Natural Area," containing an estimated 46 acres of SAF Type 101 (bald cypress), was designated in July 1959. The other area, established in December 1973, is the "Morgan Hill Research Natural Area," consisting of an estimated 67 acres of SAF Type 49, Eastern Red Cedar-Pine Hardwood. The USDA Forest Service created RNAs under the authority of the Organic Administration Act of 1897 (16 U.S.C. 551). Today, the boundaries remain unmapped and unmarked, and no plans were ever established for management of these areas.

## **ECOSYSTEM CONTEXT**

### *Central Gulf Ecosystem*

The refuge is managed within the Service's biological watershed referred to as the Central Gulf Ecosystem (Figure 6). This ecosystem once supported a vast collection of habitats. Dominant forces include heavy rainfall supporting abundant flood waters and frequent thunderstorms serving as an ignition source for natural fires and tree damage for bug infestation. Flood control, agricultural conversion, intense timber removal and alteration, past logging practices, and other human-induced alterations have affected this ecosystem, leading to significant impacts to water and soil quality, as well as plant and animal abundance and diversity.

Biological diversity, including bottomland hardwood forests and open pine forests, has been altered from historic conditions. This has resulted in degradation of the rich composition that once supported diverse communities. Forest structure and quality are influenced by site conditions and fire, as well as past land management practices. Hardwoods can be dominant over pine in many stands depending on soil moisture, soil type, aspect, and past disturbance. Historically, pine forests were widely dominant on the Central Gulf Coastal Plain. The elimination of open pine habitats has decimated some associated wildlife species throughout the ecosystem. Species most adversely affected are fire sensitive or dependent on special habitat requirements.

### *Collaboration*

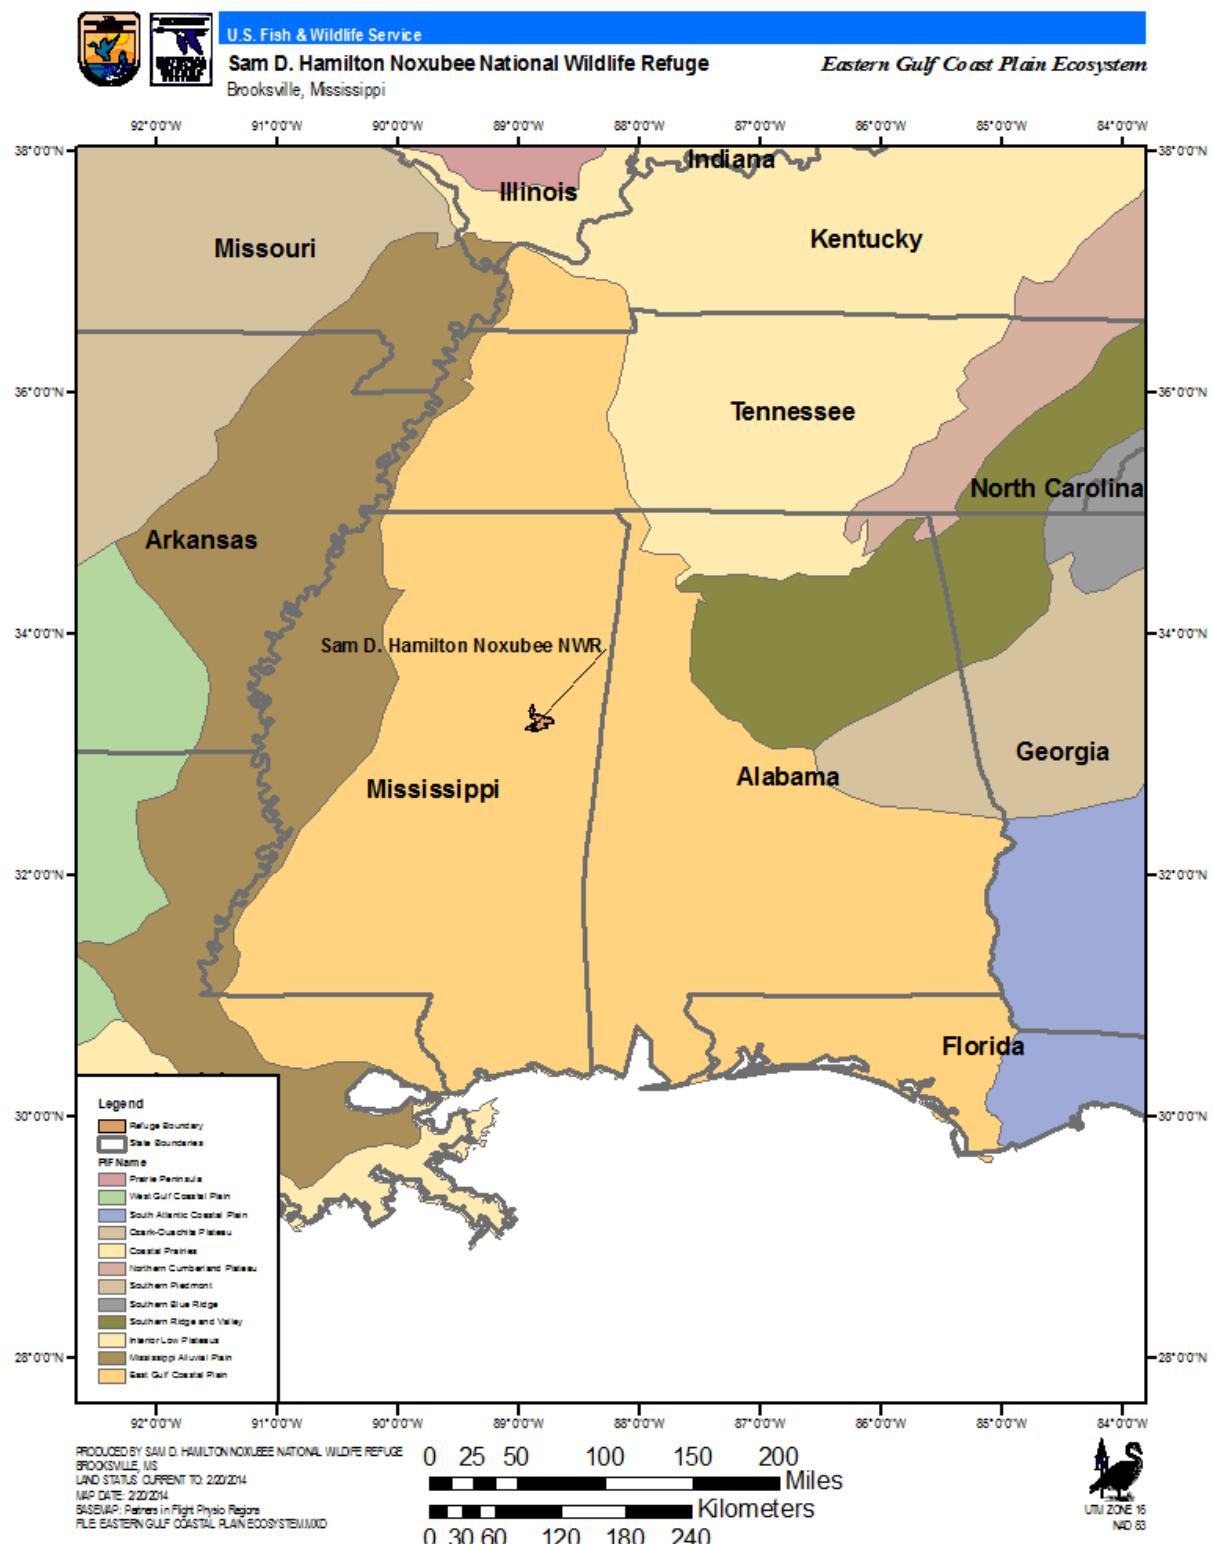

---

The Service is increasing its efforts to adopt collaborative resource partnerships with private landowners and local communities, as well as state and federal governments, within ecosystems. The purpose is to reduce the declining trend of fish and wildlife populations and biological diversity, to establish conservation priorities, to clarify goals, and to solve common threats and problems associated with fish and wildlife resources. The synergy of all federal, state, tribal, and private organizations, working together, will ensure that the Service not only protects the more important areas but also reduces redundancy and overlap.

#### *Wildlife and Public Benefits*

Resident wildlife, waterfowl, and many other migratory birds benefit from the food, protection, and sanctuary provided by the refuge's lands. Outdoor recreation, such as hunting, fishing, wildlife observation, and wildlife photography, is enhanced by refuge management programs. Water quality is enhanced by better management of hydrology on refuge wetlands.

There are 14 national wildlife refuges, 6 national forests, and 8 national parks within the state. There are three congressional designated wilderness areas in Mississippi; two are managed by Desoto National Forest and the other is managed by the National Park Service at Gulf Islands Seashore. The management of federal public lands is essential for sustaining and enhancing wildlife habitat used and enjoyed by growing numbers of people in Mississippi. State-managed lands play an additional and key role in the management of wildlife and in providing public recreational opportunities. The mission of the Mississippi Department of Wildlife, Fisheries, and Parks (MDWFP) is to conserve and enhance Mississippi's wildlife, fisheries, and parks; provide quality outdoor recreation; and engage the public in natural resource conservation. The MDWFP manages approximately 51 wildlife management areas, 20 fishing lakes, and 25 state parks located throughout the state.

**Figure 6. Location of Sam D. Hamilton Noxubee NWR within the Eastern Gulf Coastal Plain**

---

## **REGIONAL CONSERVATION PLANS AND INITIATIVES**

### *Mississippi Comprehensive Wildlife Conservation Strategy*

The Mississippi Comprehensive Wildlife Conservation Strategy (MS CWCS 2005) was developed in compliance with this congressional mandate and serves as Mississippi's blueprint for fish and wildlife conservation statewide for the next half century as noted in Chapter I. The MS CWCS is a broad set of conservation strategies for wildlife and fish species and their key habitats in greatest need of conservation which are managed by the state of Mississippi. The State of Mississippi identifies 17 key wildlife habitat types with over 60 specific subtypes. The State of Mississippi also identifies species of greatest conservation needs associated with each of these habitats.

## **ECOLOGICAL THREATS AND PROBLEMS**

The greatest ecological threats and problems are:

- loss of sustainable ecological communities;
- loss of connectivity between bottomland hardwood forest sites (e.g., forest fragmentation);
- simplification of the remaining wildlife habitats within the ecosystem and gene pools;
- cumulative habitat effects of land and water resource development activities;
- changes in habitat composition and species diversity due to fire suppression;
- control of destructive nonnative, invasive species (e.g., plants and animals) and mitigating impacts of nuisance wildlife;
- manipulation of water levels at the expense of fisheries and forestry resources;
- loss of large stands of over-mature forests;
- management of red-cockaded woodpeckers;
- suppression of fire in forested and grassland habitats;
- access roads: disturbance to wildlife and corridor for nuisance species;
- water pollution and sedimentation generated from development upstream from habitats north and east of the refuge;
- loss of riverine habitat and degraded water quality from off-refuge discharge;
- increased demands on local water supplies;
- development and management of flood control systems;
- non-appropriate use of insecticides and herbicides;
- conversion of native grasslands to pasture/agriculture; and
- lack of funding to support staffing, long-term maintenance of habitats, and infrastructure.

## **PHYSICAL RESOURCES**

### *CLIMATE*

According to the Natural Resources Conservation Service Winston County Soil Survey (2007), the refuge area has a minimum average temperature of 32.9 degrees (F). The lowest temperature on record, which occurred on December 23, 1989, is -3 degrees (F). In summer, the average temperature is 78 degrees (F) and the average daily maximum temperature is 88.5 degrees (F). The highest recorded temperature, which occurred on August 27, 1943, was 107 degrees (F).

---

Precipitation is fairly heavy throughout the year, with prolonged droughts being rare. The total annual precipitation is about 58.8 inches. Of this, 31.2 inches, or 53 percent, usually fall in April through October. In 2 years out of 10, the rainfall in April through October is less than 13.5 inches. The heaviest 1-day rainfall during the period of record was 10.3 inches on April 13, 1979. Thunderstorms occur on about 63 days each year and are most common in July.

The average seasonal snowfall is about 0.7-inch. The greatest snow depth at any one time during the period of record was 15 inches. Typically, no days of the year have at least 1 inch of snow on the ground. Severe local storms, including tornadoes, occasionally strike in the area. Storms are short in duration and can cause damage in localized areas. Every few years, in summer or autumn, a tropical depression or remnant of a hurricane that has moved inland from the Gulf of Mexico causes extremely heavy rains, lasting 2 or 3 days.

The average relative humidity in midafternoon is about 57 percent. Humidity is higher at night, and the average at dawn is about 90 percent. The sun shines 69 percent of the time possible in summer and 59 percent in winter. The prevailing wind is from the south. Average wind speed is highest, 9.2 miles per hour, in March.

The potential for rapid and lasting climate warming poses a significant challenge for fish and wildlife conservation. Species' abundance and distribution are dynamic, relative to a variety of factors, including climate. As the climate changes, the abundance and distribution of wildlife and fish will also change. Climate warming will be a particular challenge for threatened, endangered, and other "at risk" species (USFWS 2008a).

A changing climate will force change in the stewardship of the Refuge System. Potential challenges posed by a changing climate might include the following:

- Changing fire regimes;
- Changing patterns of rain and snowfall;
- Changing access to water resources;
- Altered hydrology in rivers and wetlands;
- Increased frequency of extreme weather events;
- Changes in plant community types;
- Changing abundance and distribution of fish, wildlife, and plant species; and
- Changes in the timing (phenology) of synchronized, interdependent phenomena, so that they no longer coincide.

Service managers already are seeing evidence of some of these effects in Alaska, where observed warming has been 2-4 times that of global averages and change has been more rapid and visible. Although the other regions of the Service likely will not be confronted with climate change impacts on the same scale or pace as Alaska, climactic changes in the lower 48 states will amplify current management challenges involving habitat fragmentation, urbanization, invasive species, disease, parasites, and water management. Highly specialized or endemic species are likely to be most susceptible to the additional stresses of changing climate.

The Refuge System is considering climate change in its comprehensive conservation plans, which provide a framework for guiding refuge management decisions. The Service is also looking at how projected sea level rise could affect selected coastal refuges and how wildfire could change as the result of a warming climate.

---

The Service is currently planning a series of regional forums to help collect information on the potential effects of climate change in coastal areas, mountains, prairies, and other landscapes, and to identify ways it might better prepare for managing the nation's valuable natural resources in the coming decades.

## GEOLOGY AND TOPOGRAPHY

The majority of the refuge is in the Interior Flatwoods Region of the Upper Coastal Plain with elevations rarely varying more than 20 feet throughout the area. The extreme west and southwest portion of the refuge (Bevills Hill area) lies outside this region. This region is best described as hilly, and has the greatest variation in elevations found on the refuge. Elevations can vary as much as 100 feet over a distance of several hundred feet (Figure 7). A small portion of the southeast corner of the refuge (Morgan Hill area) is adjacent to the black belt prairie region and has topography that is intermediate between the two previous regions. The area is flat to gently rolling with elevations varying as much as 100 feet, but over a longer distance, such as several thousand feet. Overall elevations range from 200 to 560 feet mean sea level.

The oldest sediments are a part of the Selma Group of Upper Cretaceous age and consist of Demopolis Chalk, Ripley Formation, and Prairie Bluff Chalk. The units are overlain by sediments of Tertiary age Formation and the Wilcox Formation. Older alluvial deposits associated with an earlier stage of drainage are found near the stream valleys. Varying bands of Cretaceous and Tertiary sediments crop out across the area (NRCS Soil Survey of Oktibbeha County, Mississippi 1973).

## SOILS

The refuge lies within the coastal plain physical division and typically has soils that are acidic and poorly drained clays, silt loam, silty clay loam, and loam from the upper coastal plains (Miller 1967). Areas of the refuge exhibit deep, somewhat poorly drained soils on slightly elevated flood plains and a small but distinct area of moderately well drained to poorly drained silty soils with slopes ranging from 0 to 8 percent. Soil associations on the refuge are as follows (Figure 8):

Stough-Freest-Vimville: Upland soil on nearly level and gently sloping, somewhat poorly drained, moderately well drained, and poorly drained, loamy soils; on stream terraces and uplands

Falkner-Longview-Savannah: Upland soil on nearly level to sloping, somewhat poorly drained, silty soils and moderately well drained, loamy soils; on uplands and stream terraces

Kipling-Savannah-Oktibbeha: Somewhat poorly drained to moderately well drained soils that have dominantly a clayey subsoil that developed from chalk, and moderately well drained soils that have a loamy subsoil and a fragipan

Leeper-Marietta-Catalpa: Nearly level, somewhat poorly drained and moderately well drained, clayey soils; on flood plains

Longview-Falkner-Prentiss: Somewhat poorly drained and moderately well drained soils that have a loamy to clayey subsoil

Mantachie-Mathiston-Ochlockonee: Somewhat poorly drained to well-drained, acid soils that have loamy to silt sub-soil.

Mathiston-Urbo: Somewhat poorly drained, acid soils that have a loamy to clayey subsoil

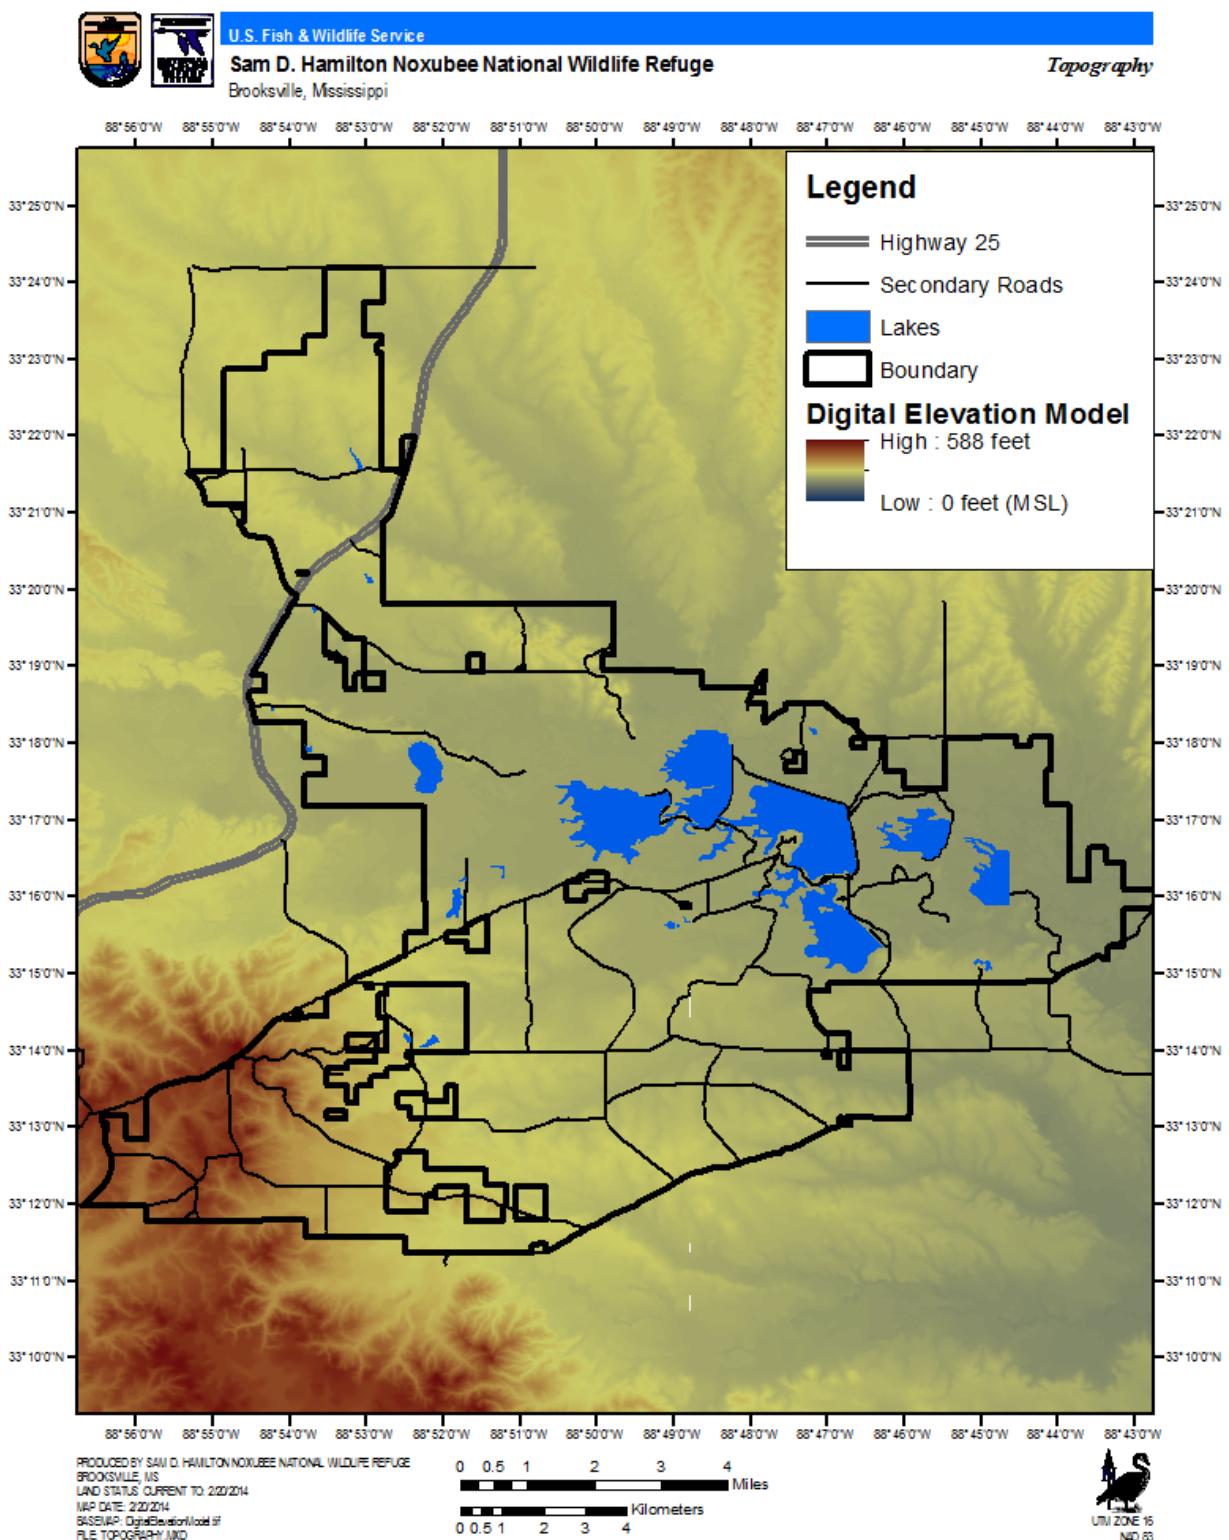

---

Smithdale-Ruston-Ora: gently sloping to steep, loamy to silty soils; on uplands

Stough-Prentiss-Myatt: Poorly drained to moderately well drained soils that have dominantly a loamy subsoil

Urbo-Mantachie-Quitman: Deep, somewhat poorly drained soils on nearly level flood plains that are fine, mixed, acid, and thermic Aeric Haplaquepts

Wilcox-Falkner: Somewhat poorly drained, nearly level to sloping soils that have clayey and silty subsoils

## HYDROLOGY

The waters of the refuge drain through the Noxubee River towards the southeast, into the Tennessee-Tombigbee Waterway. The Tombigbee River drains approximately 6,100 square miles of northeastern Mississippi and western Alabama into the Mobile River and the Gulf of Mexico. Refuge waters include more than 55 miles of streams and creeks, 20 miles of the Noxubee River, and 1,062 acres of lakes (primarily Bluff and Loakfoma) (Figure 9).

### *Water Quality and Quantity*

Waters on the refuge are influenced by levee construction, channel modification, agricultural runoff, off-refuge cattle grazing, timber harvest, and invasion of nonnative species. Wetland habitats on the refuge include Bluff and Loakfoma Lakes, GTRs, and numerous acres of small ponds, both natural and man-made. The lakes' vegetation consists of emergent species, including cattail, smartweed, wild millet, American lotus, and bald cypress. Ross Branch Reservoir is also a small man-made impoundment with similar lake habitat; however, it has slightly deeper water due to its steep banks and its primary purpose is to provide water for use within the refuge's waterfowl moist-soil management fields. Riverine areas comprise the other primary type of wetland habitat found on the refuge (i.e., Noxubee River and its tributaries). During flood events, the Noxubee River and its tributaries can inundate approximately half of the 15,507 acres of bottomland hardwood forests found on the refuge. Prominent plant species found in aquatic environments include fragrant water lily (*Nymphaea odorata*), American lotus (*Nelumbo lutea*), *juncus* sp., swamp smartweed (*Polygonum hydropiperoides*), duckweed (*Lemna minor*), and wild millet (*Panicum miliaceum*).

A study on water quality on the refuge and its influence on paddlefish was conducted in 2011 by Drs. Daniel Aboagye and Peter Allen, Mississippi State University. Water temperatures ranged from <10°C to >30°C from February to September in all locations sampled on the refuge (Bluff Lake spillway, Oktoc Creek, Noxubee River, and Halbert Lake). Dissolved oxygen ranged from 13 mg/L to 3 mg/L at the Bluff Lake spillway and Oktoc Creek. Dissolved oxygen ranged from 13 mg/L to 5 mg/L in the Noxubee River and at Halbert Lake it ranged from 8 mg/L to 1 mg/L. Bluff Lake indicated that the pool below the radial gate spillway may provide a longer duration of dissolved oxygen concentrations than surrounding areas (Aboagye, D. et al. 2011). Among other factors, turbidity was measured at all four locations. The average turbidity throughout the year at each location was 22.6 NTU at Bluff Lake, 25.8 NTU at Oktoc Creek, 18.5 NTU at Halbert Lake, and 30.3 NTU at Noxubee River (Aboagye, D. et al. 2011).

### *Noxubee River*

The Noxubee River headwaters originate in the hilly section of Winston County on portions of the Tombigbee National Forest and flow southeastwardly through Winston, Oktibbeha, and Noxubee counties. The Noxubee River has remained a naturally meandering river, and therefore, is an excellent example of a naturally functioning watershed. Twenty-five miles of the main river channel and 55 miles of tributary streams and creeks exist on the refuge. Noxubee River is a major tributary of the Tennessee-Tombigbee Waterway and is the only substantial stream within the refuge. Drainage of the refuge is by the Noxubee River and its tributaries. The drainage pattern flows from west to east via the Noxubee River and its tributaries. The principal small watersheds with their concourses within or immediately adjacent to refuge lands include Chinchahoma, Cypress, Dry, Sand, Oktoc, Jones, Loakfoma, Lynn, Yellow, Hollis, and Talking Warrior creeks. Oktoc Creek drains through Bluff Lake, thus affording the water supply for this lake, as well as for GTRs 1 and 2.

---

### *Bluff Lake*

The 609-acre Bluff Lake was created in the late 1930s by construction of a levee by the Civilian Conservation Corps (CCC) across Oktoc Creek. Approximately 150 acres of managed moist-soil habitats are located in the upper portion of the lake. A large rookery is located in the center of the lake near the Bluff Lake Boardwalk and is significantly active. The rookery routinely contains approximately 20,000 birds including cattle egrets, little blue herons, snowy egrets, and white ibis during the nesting season.

### *Loakfoma Lake*

Created by clearing bottomland hardwoods in the early 1960s, this 453-acre lake is managed primarily for waterfowl with secondary use for recreational fishing. The shallow water areas of the lake produce marginal stands of submerged and emergent vegetation consisting primarily of waterlily, sedges, pondweeds, and three square bulrushes (*Scirpus pungens*). The extensive coverage of emergent plants creates excellent habitat for brood rearing wood ducks (*Aix sponsa*), hooded mergansers (*Lophodytes cucullatus*), and gallinules (*Porphyrio spp.*). For several years the lake's recreational fishery has been hindered due to the establishment of dense stands of emergent (primarily American lotus) and submerged aquatic vegetation.

### *Ross Branch Reservoir*

This lake is approximately 34 acres in size and was created in the 1960s primarily for the purpose of providing a water source for the moist-soil impoundments of the Jones Creek Unit. Today, recreational fishing opportunities exist and the reservoir has been stocked in the past by MDFWP and Service hatcheries.

## **AIR QUALITY**

National Ambient Air Quality Standards (NAAQS) exist for six contaminants, referred to as criteria pollutants, and apply to the ambient air. Ambient air is the air that the general public is exposed to every day (USEPA 2008). These criteria pollutants include carbon monoxide, ozone, particulate matter, nitrogen oxides, sulfur dioxide, and lead.

Areas where the ambient air quality does not meet the NAAQS are said to be nonattainment areas. Areas where the ambient air currently meets the national standards are said to be in attainment. The three Mississippi counties in which the refuge is found are all in attainment for all six criteria pollutants (USEPA 2008).

---

## BIOLOGICAL RESOURCES

### HABITAT

Historically, the entire refuge was forested habitat in various successional stages (Figure 3). Forest conditions, for those species that were analyzed, supported hardwood forests consisting of 704 acres (2 percent) of white oak, post oak, southern red oak (*Quercus falcata*), and loblolly pine interspersed with oaks, hickories, blackgum (*Nyssa sylvatica*), and sweetgum. The area also supported shortleaf/loblolly pine (a.k.a. pine and pine-hardwood) forests over approximately 21,304 acres (44 percent) of the refuge. The historic forest conditions analysis indicates approximately 19,306 acres (40 percent) of bottomland hardwood forests were within the refuge consisting of water oak (*Quercus nigra*), willow oak (*Quercus phellos*), cherrybark oak (*Quercus pagoda*), overcup oak (*Quercus lyrata*), American beech (*Fagus grandifolia*), blackgum, and sweetgum. Historic forest conditions depict bald cypress and gum swamp forests that were nearly pure stands of American bald cypress which constituted approximately 6,904 acres interspersed throughout the bottomland hardwood forests.

Since establishment of the refuge, approximately 36 percent (17,145 acres) of the refuge no longer represents the historical conditions (Figure 4). An estimated 1,117 acres of bottomland hardwoods and cypress forest, approximately 2 percent of the refuge, have been converted to lakes. Loblolly pine forests now cover the majority of upland sites on the refuge due to soil stabilization plantings that occurred in the late 1940s and 1950s. Prior to fire suppression, loblolly pine was a minor component of riparian and other mesic forests and a secondary component of mixed pine and pine hardwood forests in these interior uplands of Mississippi. Forests dominated by loblolly were rare and restricted to a part of southern Arkansas and perhaps eastern Virginia and northeastern North Carolina. Currently, because of the fire suppression of the past century, loblolly pine is the dominant pine throughout the southeast in areas that were historically covered by longleaf pine, shortleaf pine, and shortleaf - loblolly pine forests (USFWS 2003).

### Forest Management

Currently, the majority of the refuge, 94 percent, consists of forested habitat; however, differences exist within the amounts and distribution of the forest types when compared to the LANDFIRE (2008) model for historic forest conditions (Figure 4). Today, hardwood forests are overrepresented by 7,312 acres; pine dominated forests are only slightly underrepresented by 331 acres; bottomland hardwood forests are underrepresented by approximately 3,727 acres; and, bald cypress and gum swamp forests are the most underrepresented forest type by approximately 5,775 acres. Non-forested lands consist of lakes, developed lands, rights-of-way, and roads.

A variety of silvicultural techniques are used to manage forests, with an emphasis on providing habitat for threatened and endangered species, migratory birds, and other resident wildlife. Commercial timber harvesting is frequently utilized where appropriate to accomplish larger scale silvicultural treatments such as forest stand improvements, stand regeneration, and disease control. Refuge staff may be used when conducting single tree or small group selection tree removals. Staff is also used when completing some other forms of timber stand improvement such as the use of herbicides.

### Forest Management History

In the early 19th century, much of the current refuge property was cleared and converted to agricultural use by Euro-American settlers. By the late 1930s, many areas within the current refuge's boundary showed severe signs of soil erosion and was considered only marginal crop land. As part

---

of initial restoration work that occurred between 1935 and 1940, more than 1,000 acres of cypress forest were cleared to create Bluff Lake. By the early 1950s, refuge staff had created soil erosion barriers and 75 percent of the abandoned fields were reverting back to forest through yearly plantings of loblolly pine and natural regeneration of light seeded trees. Today as restoration continues, the majority of the refuge, 94 percent, consists of forested habitats. Three lakes and several small wetlands were created along with four GTRs. Management of the refuge's forested habitats has included prescribed fire, use of herbicides, and commercial harvest of timber since the establishment of the refuge. The six SAF Forest Cover Types under which the refuge has been managed include:

Upland Hardwood Forests - The upland hardwood forest is found on the refuge's gentle to moderate slopes near Douglas Bluff and Bevill's Hill. It consists of mixed oak, oak-pine, and mixed hardwood communities. Two forest cover types are recognized within the refuge's upland hardwood forests.

The first cover type, White Oak – Black Oak – Northern Red Oak (SAF Cover Type 52), is an upland xeric site association in which the species compositions change depending upon elevations. The oaks dominate the stand with hickories comprising a smaller component. Other tree species occurring are yellow poplar (*Liriodendron tulipifera*), blackgum, red maple, ash, elm, sweetgum, shortleaf pine, and loblolly pine. Dogwood (*Cornus* spp.), sassafras (*Sassafras albidum*), serviceberries (*Amelanchier* spp.), redbud (*Cercis canadensis*), hophornbeam (*Ostrya virginiana*), American beech, witch-hazel (*Hamamelis* spp.), sparkleberry (*Vaccinium arboreum*), wild grapes (*Vitis* spp.), greenbriers (*Smilax* spp.), and poison-ivy (*Toxicodendron radicans*) are found in the midstory and understory. Common herbaceous species are mayapple (*Podophyllum peltatum*), trillium (*Trillium* spp.), wild ginger (*Alpinia* spp.), bellworts (*Uvularia* spp.), asters (*Aster* spp.), and goldenrod (*Solidago* spp.). The type is a subclimax or climax depending upon the geographic location and site index.

The second cover type, Loblolly Pine – Hardwoods (SAF Cover Type 82), dominates no more than 20 percent of the overstory. Within Mississippi, this cover type occurs on sites ranging from coastal swamps to xeric sites. The hardwood components consist of a mixture of sweetgum, water oak, cherrybark oak, swamp chestnut oak (*Quercus michauxii*), ash, yellow poplar, elm, red maple, and hickories. Shrubs and midstory trees include wax myrtle (*Morella cerifera*), American beautyberry (*Callicarpa americana*), possumhaw (*Ilex decidua*), sparkleberry, dogwood, and hawthorns (*Crataegus* spp.). Common vines include blackberries (*Rubus* spp.), greenbriers, grapes, and honeysuckle (*Lonicera japonica*). This cover type develops toward a hardwood climax (Mississippi Museum of Natural Science 2005).

A majority of the hardwood forests on the refuge are mature hardwood forest stands with less than 50 percent pine. Most of these forests are 70 to 90 years old. These upland forests have been passively managed and fire has been largely excluded over the past several decades. Throughout the upland hardwood forests, older trees are periodically lost from insects, lightning, wind-throw, diseases, and natural mortality, creating good vertical structure and species diversity in the midstory. The interspersion of vertical structure created by the over-story canopy gaps is desirable for many land birds.

Pine Forests - The refuge's pine forests occur on upland hills and flats. At present, these managed stands of pine form the dominant cover type on the refuge. The majorities of the refuge's loblolly pine stands are currently in the 70-year-age-class and originates from the plantings and regrowth of the forest following the refuge's establishment. The majority of loblolly pine on the refuge is expected to survive until the approximate age of 100 to 120 years. Shortleaf and longleaf pines also naturally occur on the refuge and can have two to three times the longevity of loblolly pine. Shortleaf and longleaf pine forests are an important part of the refuge's historic habitat structure. Historically,

---

shortleaf pine communities included those without hardwoods and those with a small hardwood component (USFWS 2003). Longleaf pine exists within the shortleaf areas, but has not been dominate within the overstory. Without active management to regenerate new stands of loblolly pine, the current loblolly forest, as a whole, will begin senescence. If not replaced by new regenerated loblolly or shortleaf or longleaf pine, the ability of the forest to meet the needs of the red-cockaded woodpecker will decrease as the age of the stand extends beyond 100 years of age. Several factors contribute to the timing of this approaching mortality to loblolly pine such as general tree health, insects, lightning, wind-throw, and diseases. Within the pine areas, two forest cover types are currently managed.

One cover type, loblolly pine – shortleaf pine (SAF Cover Type 80), is comprised of a majority of loblolly pine, some locations containing longleaf and shortleaf pine. Other overstory species associated with the loblolly, longleaf and shortleaf pine include southern red oak, white oak, persimmon (*Diospyros virginiana*), blackgum, hickories, and flowering dogwood (*Cornus florida*). When prescribed fire is not used in an area, hardwoods species are common in the midstory. With prescribed fire, Panicums (*Panicum spp.*), sedges (*Carex spp.*), and little bluestem (*Schizachyrium scoparium*) are common undergrowth with little midstory being found. This cover type is transient and will convert to an upland oak climax without continued disturbance.

The other cover type, loblolly pine (SAF Cover Type 81), is composed of either pure stands of loblolly pine or various mixtures in which loblolly pine comprises the majority of the overstory. It occurs on a variety of soils from well-drained upland soils to somewhat poorly drained flatwood soils. The occurrence of the loblolly pine cover type is widespread on the refuge due to historic plantings of the species and active management for this cover type. The most common species associated with loblolly pine within this cover type include sweetgum, water oak, willow oak, cherrybark oak, red maple, hickories, and blackgum. The associated species are also common in the midstory. Dense, young stands support sparse herbaceous vegetation, but as the stand opens up, other species may appear. This cover type tends to be successional and temporary unless maintained through active management (Mississippi Museum of Natural Science 2005).

**Bottomland Hardwood Forests** - The refuge's bottomland hardwood forests are found within the small drainage ways, floodplains, stream terraces, and leveed GTRs. Areas along Noxubee River and its tributaries contain the majority of this habitat.

Within the bottomland hardwood forest, the refuge manages for one cover type, Sweetgum – Willow Oak (SAF Forest Cover Type 92). Species composition in this cover type is determined by soil condition. On well-drained first bottom ridges and terrace flats with silty clay soils, sweetgum will dominate the stand. Oaks will dominate on clay soils. Willow oak and water oak will be found on the first bottom ridges with better drainage. Nuttall oak (*Quercus texana*) occurs on the first bottom flats. Other species associated with this cover type are sugarberry, ash, elm, overcup oak, hickory, Eastern cottonwood (*Populus deltoides*), persimmon, red maple, and rarely bald cypress. The associate species also are the dominant midstory species. The herbaceous layer can commonly include greenbrier, poison-ivy, redvine (*Brunnichia ovata*), mayapple, jack-in-the-pulpit (*Arisaema triphyllum*), netted chainfern (*Woodwardia areolata*), and jumpseed (*Polygonum virginianum*) (Mississippi Museum of Natural Science 2005).

The majority of the lower slope and high-terrace hardwood forests are mature and beginning to sustain greater levels of tree mortality. Mast-producing species, such as oaks, are being lost without replacement from these locations at an alarming rate. Regeneration of shade-intolerant mast producing species requires a readily available seed source within the same forest. With seeds present, gaps within the forest canopy allow sunlight to reach the forest floor and new oaks to grow.

---

Management and harvest of trees within bottomland hardwood stands can create conditions for the regeneration of shade-intolerant species, as well as provide cover, food, and structure for wildlife. Without the creation of canopy gaps, the shade-intolerant species will gradually be phased out of this system, only occasionally occurring at naturally disturbed locations such as storm blow-down sites. Location of bottomland hardwood forests left undisturbed have shifted toward shade-tolerant tree species such as ironwoods, sugarberries, and elms. A forest made up of these shade-tolerant species provides limited food resources for a variety of wildlife.

Bald Cypress/Gum Swamp Forests - The refuge's Bald Cypress forests (SAF Cover Type 101) are found around oxbow lakes, low floodplain terraces, bottomland flats, and backwater areas of the man-made lakes and reservoirs. This cover type exists in areas that are seasonally to semi-permanently flooded and remain saturated for long periods throughout the year. Its major associates are water tupelo and blackgum. Minor associates include black willow (*Salix nigra*), cottonwood, ash, water hickory (*Carya aquatica*), and overcup oak. The midstory may include buttonbush (*Cephalanthus occidentalis*), eastern swampprivet (*Forestiera acuminata*), acuminate (*Forestiera acuminata*), and Virginia sweetspire (*Itea virginica*). The ground cover will contain species such as whitegrass (*Leersia virginica*), waterwillow (*Justicia americana*), swamp sedge (*Carex joorii*), and opposite-leaf spotflower (*Acmella oppositifolia*), depending upon the amount of shade (Mississippi Museum of Natural Science 2005).

Most of the refuge lakes and wetlands are classified under this cover type. Bald cypress is largely interspersed throughout the bottomland hardwood forests especially along streams. Like much of the forest, most of the bald cypress existing on the refuge is relatively young and estimated at approximately 90 years in age. Bald cypress is a long-living tree species, which has been known to survive over a thousand years. Bald cypress is an important wildlife tree species because of cavity development and nest and roost trees.

#### *Prescribed Fire and Wildfires*

Wildfires are documented to have occurred within refuge boundaries, but at present are very infrequent mainly due to management of fuel loads via prescribed fire with pine and pine-hardwood habitats. Most fuel load buildup within pine habitats on the refuge is less than three years (Figure 10). In pine-hardwood habitats with three or more years of fuel loading, some areas have more than seven years of fuel loading. The refuge's most recent Fire Management Plan stipulates that wildfires causing direct threat to resource or assets will be confined to reduce unplanned damage.

Prescribed fire is an important tool in the management of unwanted hardwoods and other midstory vegetation within the pine habitats on the refuge when conducted during the growing season. Non-growing season burns are mainly used to reduce fire fuel loading and reduce the risk of wild fires. Prescribed fire has been used to treat approximately 6,000 acres of forested habitat each year for the benefit of the red-cockaded woodpecker (RCW) through the improvement of forage habitat conditions. The majority of this burning is accomplished in pine habitats and to a lesser extent in pine-hardwood habitats where spring burns are used to both control hardwoods and stimulate growth of native grasses. Numerous wildlife species (e.g., RCW, Northern bobwhite, turkey, Henslow's sparrow, and butterflies) benefit from the increased production of grasses and forbs encouraged by the fire. Use of prescribed fire on the refuge primarily retards succession in the mid- and lower-story woody vegetation as it eliminates shrubs and small trees, allowing increased growth of grasses and herbaceous plants. Additional benefits of prescribed fire include reducing the risk and catastrophic effect of wildfire, as well as functioning to recycle nutrients locked up in woody vegetation. Hand raking, fire lines and fire equipment is used to protect areas that could be harmed by fire.

## *Exotic and Pest Species*

Exotic and pest species occur throughout the refuge, including terrestrial and aquatic systems. By definition, exotic species are nonnative to the region. Invasive also refers to introduced species that adversely affect the habitats and bioregions they invade both economically and environmentally. Nuisance species are native organisms that, given specific population levels or locations, cause or are likely to cause harm to the particular habitat under consideration. Collectively, this category of species interferes or has the potential to affect other natural plant and animal communities in which they share the habitat (750/751 FW 1, USFWS 2009).

There are many identified exotic and nuisance species of known threat to the refuge. Of these, seventeen plants and seven animal species are of particular concern (Volume II, Integrated Pest Management Plan). For example, beaver, considered a pest species, activity results in unwanted flooding of bottomland hardwood areas during the growing season, clogging of water control structures, and burrowing and digging into levees, which leads to breaches in the levee or leaks around water control structures. Feral hogs, an exotic species, are destructive both to habitat and wildlife and a newly detected fast-growing problem on the refuge.

Pest plants represent a large number of native species that under certain conditions interfere with management objectives. Native broadleaf plants can significantly compete with planted cereal grains and result in decreased yield or complete crop failure if not controlled. An example of this would be sicklepod (*Senna obtusifolia*) and rattlebox (*Sesbania spp.*), which are stimulated to sprout by soil disturbance and may be 4-6 inches tall before planted crops break ground. Other native plants can be classified as a nuisance after they have expanded beyond a desired density or acreage. This would include common moist-soil and aquatic plants that may compete with more desired plants for waterfowl or create dense floating mats of vegetation without an interspersion of open water.

Several invertebrates are considered exotic on the refuge. The major terrestrial exotic invertebrate animal is the red imported fire ant (*Solenopsis invicta*). Widely distributed on the refuge in all habitats, this ant is known to negatively affect native insects and animals. Unfortunately, large-scale control measures are not currently applicable. Within the aquatic system, the Asian clam (*Corbicula fluminea*) is considered an exotic species. This nonnative bivalve can be found in all permanently flowing streams on the refuge. At high concentrations, the mussel may displace native mussel populations by creating cobbled substrate not suitable for native species and create a solid bed of live and dead shells. Native pest invertebrates include fall armyworm (*Spodoptera frugiperda*) and southern pine beetles (*Dendroctonus spp.*, and *Ips spp.*). Fall armyworm becomes a pest when levels interfere with early growth of planted grains. Initial attacks easily kill young growing plants. At higher levels, pesticide use may be warranted to minimize damage to maturing crops. Southern pine beetles are extremely beneficial to wildlife at endemic population levels. The mortality of individual or small groups of trees provides a substrate for invertebrates beneath the bark. These trees are heavily used by foraging woodpeckers and subsequently provide sites for primary cavity nesters. However, epidemic population levels can result in large-scale stand mortality. This cyclic population level results in loss of pine stands utilized by a large number of birds and other wildlife. The federally endangered RCW's life history is centered on the long-term stability of pine stands. Therefore, stand-level replacement caused by beetle infestations could pose a threat to habitat for RCWs.

---

## *Fields*

Refuge fields are managed to produce a variety of early successional vegetation types. Many fields were previously planted with grain crops, such as sorghum, wheat, or lespedeza, to provide food for wildlife species such as waterfowl and quail. Other fields are left fallow to provide a more natural annual plant community of native forbs and grasses, many of which have value as food or cover for wildlife. Still other fields are maintained in perennial grasses, such as Bermuda, dallis, and fescue.

Old fields or fallow lands contain a variety of annual and perennial plants, including purpletop tridens (*Tridens flavus*), velvet panicum (*Dichanthelium scoparium*), bristlegrass (*Setaria* spp.), bahiagrass (*Paspalum notatum*), Johnsongrass (*Sorghum halepense*), bluegrass (*Poa* spp.), Bermuda grass (*Cynodon dactylon*), cheatgrass (*Bromus tectorum*), cattail sedge (*Carex typhina*), little barley (*Hordeum pusillum*), little bentgrass (*Agrostis* spp.), bittercress (*Cardamine* spp.), butterweed (*Packera glabella*), bedstraw (*Galium* spp.), buttercup (*Ranunculus* spp.), chervil (*Chaerophyllum* spp.), chickweed (*Stellaria*, *Holosteum*, and *Cerastium* spp.), clover (*Trifolium* spp.), cornsalad (*Valerianella* spp.), corn speedwell (*Veronica arvensis*), crowpoison (*Nothoscordum bivalve*), dwarfdandelion (*Krigia* spp.), fleabane (*Erigeron* spp.), forget-me-not (*Myosotis verna*), garlic (*Allium* spp.), lyre-leaf sage (*Salvia lyrata*), plantain (*Arnoglossum* spp.), medic (*Medicago lupulina*), and toadflax (*Linaria* and *Nuttallanthus* spp.). Over 820 acres of fields have been managed on the refuge. Nonnative plants have become established in many existing fields.

## *Prairie Demonstration Area (Morgan Hill)*

The Blackbelt Prairie Region historically existed as a portion of land extending from the Tennessee border in an inverted arc through Mississippi into eastern Alabama, supporting native prairie. This crescent-shaped region covered approximately 8,700 square miles and extends from McNairy County, Tennessee, south across East-Central Mississippi and east to Russell County, Alabama. Today, the Black Belt Prairie has been listed as one of the critically endangered ecosystems in the United States, with less than 1 percent still remaining. This makes it the most degraded habitat type in Mississippi. Very small isolate remnant patches (less than 100 acres) remain in the northeastern part of the state (Jones et. al. 2007; Mississippi Museum of Natural Science 2005), in cemeteries, 16th section lands, and on Tombigbee and Bienville National Forests (Wildlife Mississippi).

Currently, the refuge has 85 acres of non-black belt prairie soils (e.g., Kipling Silt Loam, Sumter Silty Clay) being managed as a demonstration area for this off-refuge habitat type. The closest location of the native Black Belt prairie is several miles east of the refuge and consists of Selma Chalk soil type. The demonstration prairie area is managed using prescribed fire for planted native prairie species, including little bluestem, Cherokee sedge (*Carex cherokeensis*), yellow Indian grass (*Sorghastrum nutans*), prairie coneflower (*Ratibida pinnata*), false foxglove (*Agalinis* and *Aureolaria* spp.), and a variety of asters. Eastern red cedar (*Juniperus virginiana*) and a variety of prairie grasses form small glades in this area. The cedar glades are regarded as a degraded form of the prairie community (Mississippi Museum of Natural Science 2005).

---

### Douglas Bluff

There exist several clearly identifiable microhabitats within the Douglas Bluff area of the refuge that contain specialized and often uncommon or rare plant communities. The area's north facing slope runs along the edge of Oktoc Creek, which promotes a stable moisture regime. In 1976, Dr. Ray Watson, Mississippi State University, Department of Biological Sciences, recommended it be considered by the Service as a Research Natural Area, because of its unique and rare botanical diversity. He identified 85 plant species with fairly narrow habitat distribution or collectively uncommon locally on the bluff.

Some of these species included Pachysandra (*Pachysandra procumbens*), early Saxifrage (*Saxifraga virginiensis*), and bloodroot (*Sanguinaria canadensis*). Trillium and other herbaceous plants are isolated along the ridge line. Several woody plants, including American chestnut (*Castanea dentata*), bladdernut (*Staphylea trifolia*), Allegheny chinkapin (*Castanea pumila*), and fringetree (*Chionanthus virginicus*), can also be found as associates along the bluff. Although the designation was not pursued, Douglas Bluff has been established as an educational use only area.

### Other Aquatic Habitats

The aquatic type habitats include a reservoir, two lakes, multiple moist-soil impoundments, numerous artificial ponds, natural beaver ponds, creeks, and the Noxubee River and its tributaries. The mostly un-channelized Noxubee River is a complex floodplain river system. The two man-made lakes and the one reservoir at Ross Branch support a wide variety of native fish and other aquatic life. The dynamic nature of the flooding regime and associated wetland habitats provide a renewable fishery resource on the refuge. The creeks, sloughs, and lakes support a diverse warm water fishery, including largemouth bass (*Micropterus salmoides*), spotted bass (*M. punctulatus*), black crappie (*Pomoxis nigromaculatus*), white crappie (*P. annularis*), bream (*Lepomis* spp.), channel catfish (*Ictalurus punctatus*), flathead catfish (*Pylodictus olivaris*), and blue catfish (*I. furcatus*). Nongame fish such as common carp (*Cyprinus carpio*), freshwater drum (*Aplodinotus grunniens*), and bigmouth buffalo (*Ictiobus cyprinellus*) are also found in refuge waters. When flooding occurs in the spring, these areas provide excellent nurseries for juvenile fish. These waters also provide essential habitat for a host of reptile and amphibian species. The moist-soil impoundments total approximately 314 acres and are dispersed throughout the refuge. Four GTRs exist on the refuge, comprising of approximately 1,359 acres that are flooded for use by wintering waterfowl. Resident and migratory wildlife use these areas for resting, foraging, breeding, and nesting. Due to erosion, the refuge's man-made lakes are increasingly losing water depth. Both the marshy shore and open waters provide excellent wildlife habitat for a variety of species. Bluff Lake and Loakfoma Lake are both up to 12 feet in depth in limited locations. Loakfoma Lake was recently rehabilitated because of invasive species. The Ross Branch Reservoir provides water to flood nearby moist-soil impoundments through gravity flow. Water control structures associated with these features allow unique water management options.

### Streams

A wide variety of wildlife is dependent upon streams for its survival, including mussels, fishes, amphibians, and reptiles. The refuge's approximately 1,700 acres of riparian zone habitats created by streams sustain the most dynamic collection of wildlife. Healthy riparian zones provide organic input and woody structure into stream channels, as well as stabilize the stream banks.

---

The refuge is located in the Tombigbee Basin Drainage. Streams existing upon the refuge are tributaries of the Tombigbee River. This river has been highly modified by the construction of the Tennessee-Tombigbee Waterway. This waterway created a series of impoundments and canals with locks and dams to improve navigation. The series of locks and dams isolated many tributaries. Tributaries of the Tombigbee River that flow through the refuge include Noxubee River, Chinchahoma, Talking Warrior, Cypress, Jones, Oktoc, Loakfoma, Lynn, Little Yellow, and Dry Creeks. Approximately 80 miles of streams crisscross the refuge.

#### *Moist-soil Impoundments*

Moist-soil impoundments are man-made wetlands designed to produce annual plants and invertebrates for use by waterfowl, shorebirds, and wading birds. When not planted in agricultural crops, these units normally are naturally vegetated by Cyperus spp., barnyardgrass (*Echinochloa crus-galli*), millet spp., smartweed spp., and several other species that benefit wildlife. The refuge's impoundments are primarily flooded during the late fall and winter months for wintering waterfowl. The nutritious seeds and invertebrates provide critical food for the migrating waterfowl. The Jones Creek moist-soil area is subdivided into 16 small impoundments. These impoundments give the refuge the ability to manipulate multiple water levels during certain times of the year to promote desirable moist-soil plants and wildlife uses. During spring, the impoundments can be dewatered to provide mud flats for migrating shore and wading birds. The moist-soil management consists of a method of using the timing and rate of dewatering, soil disturbance, stage of plant succession, and the timing and rate of re-flooding to provide the best environment for the target wildlife. Intensive soil manipulation is necessary over the long term to prevent units from converting into willow thickets. Agricultural crops may be used as part of a field's soil disturbance rotation. The refuge's moist-soil units total 314 acres consisting of 17 individual units varying in size. Ross Branch Reservoir provides the irrigation water to flood the 11 impoundments within the Jones Creek unit; the five remaining units depend on rainfall for water.

#### *Greentree Reservoirs (GTRs)*

GTRs are typically created by impounding a stand of bottomland hardwoods using a levee and water control structure system. These impoundments are designed to hold water on bottomland hardwoods during the trees' dormant season, fall and winter, to prevent tree death, thus the name "greentree". The flooded impoundments are designed to provide nuts, acorns, vegetation, and invertebrates for wintering waterfowl when kept at a water depth less than 18 inches. GTRs can also provide important resting and loafing habitat for wintering waterfowl. Four GTRs exist on the refuge and total about 1,359 acres.

## **WILDLIFE**

### **Threatened and Endangered Species**

A key objective of the refuge is to provide habitat and protection for threatened and endangered species. At this time, there are two federally listed threatened or endangered animal species, which may be associated with the refuge. They include the RCW (endangered) and the wood stork (proposed listing of threatened in Mississippi).

---

### *Red-cockaded Woodpecker (RCW)*

The RCW was listed in the *Federal Register* as endangered in 1970 (35 FR 16047), and received federal protection under the Endangered Species Act of 1973, as amended. At one time, the RCW was a common bird distributed across the southeastern United States, but by the time of listing, the RCW had declined to fewer than 10,000 individuals. The RCW selects mature, older-aged, open canopy pine dominated (i.e., pine and pine-hardwood stands) stands with low ground cover of grasses and forbs. Its' decline has been traced to the overall loss of older-aged, open-pine forests in the south, a fire-dependent ecosystem to which the RCW has adapted. The refuge's population goal as listed in the 2003 RCW Recovery Plan is 88 groups. This goal was a non-spatially explicit estimate of the sustainable carrying capacity based on the number of quarter-mile partitions divisible within the total cumulative acres of the pine forest habitat (pine for this document represents pine and pine hardwood types) found throughout the refuge (i.e., 22,000 acres of pine / 250 acres per partition = 88 groups). During 2014, the refuge was home to 28 active clusters (groups) of RCWs; the term cluster refers to a single group's cavity trees and to be considered active at least one bird must occupy the partition.

The population of birds at the refuge is listed as a support population. The refuge population is designated as a significant support population in the Service's 2003 RCW Recovery Plan. Areas designated as primary core, secondary core, or essential support populations in the 2003 RCW Recovery Plan are required for specific population size objectives for the purposes of downlisting the species to threatened, and a future delisting. Significant support populations like that found on the refuge, while not specifically required for downlisting or delisting, provide recovery support to enhance RCW dispersal among populations, reduce the loss of genetic variation, and serve as a potential source for translocation to augment critically small populations. The RCW has the highest position in the refuge's management priorities.

The refuge RCW population consisted of at least 26 active groups in 1971, followed by a decline to 8 active groups in 1985, after which time artificial cavity inserts were developed and more intensive and extensive RCW habitat management ensued (Richardson 1991). The extensive management activities included treatments to remove hardwood midstory encroachment at 24 established clusters, providing artificial cavity inserts for at least 4 suitable cavities for each cluster, establishing artificial recruitment clusters to increase the population, and reducing cavity competition by southern flying squirrels and predation by gray rat snakes (Richardson and Stockie 1995). From 1986 to 1992, with the help of translocations of birds from within the population, the population increased from 16 to 32 active groups at an average annual geometric growth rate of 0.12 (12 percent). By 2000, the population peaked at 48 active groups. However, since 2000, the population has experienced a net decline reaching 28 active groups in July 2014. A summary of the refuge's 2014 population follows:

68 adult (51 birds banded, 17 birds unbanded) RCWs were observed within population;  
average group size for population was 2.4 adult birds

55 total clusters monitored (Figure 11)

28 active clusters with birds

27 clusters contained potential breeding groups

26 groups nested

42 fledged young recorded

0 clusters captured by adjacent groups

1 cluster contained solitary male bird

18 inactive clusters with no birds present during year

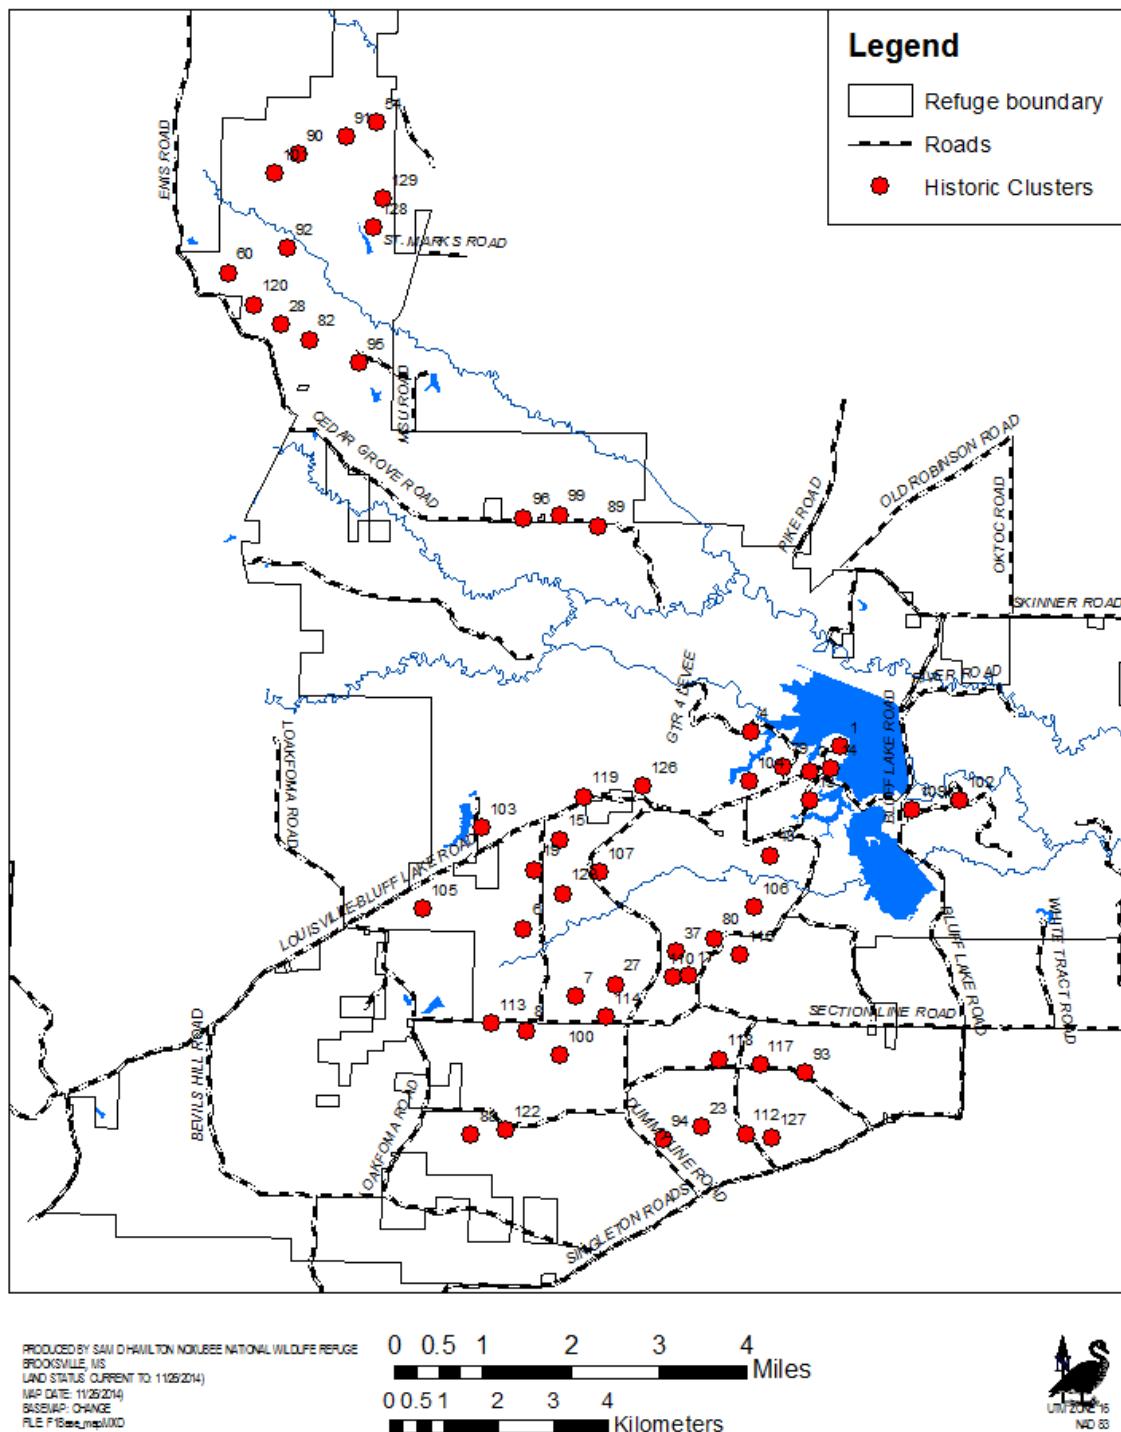

9 abandoned clusters with no birds present for multiple years

U.S. Fish &amp; Wildlife Service

Sam D. Hamilton Noxubee National Wildlife Refuge  
Brooksville, Mississippi

## Historic RCW Cluster Map

**Figure 11. Location of 55 monitored active, inactive and abandoned red-cockaded woodpecker clusters and partitions, Sam D. Hamilton Noxubee NWR, 2014**

Within the refuge's habitats, forest management practices such as selective cutting to control basal area and hardwoods, regeneration of forest stands using even-aged methods, and intensive prescribed burning are the primary management tools used to improve and sustain mature pine habitat as a home for this federally endangered bird. In addition, artificial nest cavity inserts are often required in mature pine trees to supplement natural cavity trees and to encourage establishment of new RCW clusters. It is the goal of management to provide RCWs with sustainable Good Quality Foraging Habitat (Table 1).

**Table 1. Good quality foraging habitat criteria (Red-cockaded Woodpecker Recovery Plan, USFWS 2003**

Good Quality Foraging Habitat (GQFH) Criteria
<ul style="list-style-type: none"><li>• 18 or more stems per acre of pine that are at least 60 years of age and 14" dbh</li><li>• minimal pine BA of 20 square feet per acre</li><li>• BA of pines 10-14" DBH is 0 to 40 square feet per acre</li><li>• BA of pines less than 10" is 10 square feet per acre and less than 20 stems per acre</li><li>• BA of all pines more than 10" DBH is at least 40 square feet per acre</li><li>• groundcover of native bunchgrass or other native, fire-tolerant, fire-dependent forbs total 40% or more of ground cover and midstory plants and are dense enough to carry growing season fire at least once every 5 years</li><li>• no hardwood midstory exist or it is sparse and less than 7 feet in height</li><li>• canopy hardwoods are absent or less than 30% of canopy</li><li>• the entire foraging habitat is within 0.5-mile of center of cluster, and 50% is within 0.25-mile of center of cluster</li><li>• foraging habitat is not separated by more than 200 feet of non-foraging areas; non-foraging areas include: (1) any predominately hardwood forest; (2) pines stands less than 30 years in age; (3) cleared land; (4) paved roads; (5) utility right-of-way; and (6) water</li><li>• total stand BA for loblolly forest should be kept below 80 square feet per acre</li><li>• minimum canopy spacing of 25 feet</li></ul>

Currently, none of the active RCW partitions on the refuge meet the recovery objective of providing sustainable GQFH; the term partition refers to habitat located within a 0.5-mile radius of the group's nest trees. It is currently estimated that 300 acres of pine habitat is needed to sustainably meet the needs of a RCW group with the refuge. The current amount of pine forest within the partitions varies amongst RCW clusters on the refuge:

- 21% of partitions have more than 100 acres but less than 200 acres of pine habitat
- 50% of partitions have more than 200 acres but less than 300 acres of pine habitat
- 25% of partitions have more than 300 acres but less than 400 acres of pine habitat
- 4% of partitions have more than 400 acres of pine habitat

In summary, the use of artificial cavities has allowed clusters to be expanded throughout the refuge, but the number of RCW groups sustainable for the long-term within the refuge's habitats depends on the amount of pine habitat existing within large enough continuous blocks to perpetuate partitions meeting GQFH. Partitions with more continuous pine habitat are more sustainable than those with smaller acres. It is estimated that RCW groups need 120 acres to meet their biological needs and it takes 300 or more acres of loblolly pine to ensure these 120 acres are available perpetually through time.

---

### *Wood Storks*

Wood storks are a tropical and subtropical species that generally breed in South America, Central America, and the Caribbean. It is the only breeding stork in the United States. A small breeding population exists in Florida, Georgia, North Carolina, and South Carolina. The wood stork was listed as an endangered species in the eastern United States in 1984 due to declines in wetland breeding, foraging, and nesting habitats. In 2006, 10,000 nesting pairs of wood storks were recorded within the continental United States. In 2007, the Service recommended changing the status of wood storks from endangered to threatened species.

The refuge is currently located in the migration route of both eastern and western populations of wood storks. Upwards of 10 percent of the eastern post-breeding and non-breeding stork population migrates into Mississippi. Currently, there are no breeding pairs of wood storks found on the refuge. However, each summer wood storks forage in wetland and shallow water habitats on the refuge, particularly those associated with the Jones Creek Unit, and Bluff and Loakfoma lakes. Stork numbers gradually increase starting in June and peak in July as birds undergo a reverse summer migration following receding water conditions. In early September storks return to their breeding grounds. Recently, the wood stork has been proposed listed as threatened in Mississippi with no final ruling being made.

### *Northern Long-Eared Bat*

The northern long-eared bat (*Myotis septentrionalis*) is currently a “proposed endangered” species under the Endangered Species Act. Historically, it was considered a summer resident or transient in Mississippi. There are no known occurrences of this species on the refuge.

## **RESIDENT AND OTHER SPECIES**

### *Bald Eagles and Golden Eagles*

During the early establishment of the refuge, the bald eagle was an uncommonly seen bird coinciding with the significant decline of the species within the lower 48 states. Anecdotal comments from the annual narratives indicated the species was most often observed as a late fall-winter resident and absent during the spring-summer. This former temporal period provides the most abundant food resources with large numbers of migratory waterfowl present. Currently, up to two golden and seven bald eagles have been documented using the refuge.

Collectively in Mississippi, bald eagles have rebounded dramatically within the past 20 years with annual increases in the number of occupied nests. On the refuge, confirmed nest building did not happen until the mid-1980s. In the late 1990s, the first-ever documented, successful eagle nest occurred on the refuge. The nest was located in a pine stand just south of the Smith Fields. The pair utilized the site annually until the nest was toppled by a wind storm. Subsequently in 2007, the pair began using a nest one-half mile away, which had been constructed a year prior, within a red-cockaded woodpecker cluster adjacent to the Doyle Arm of Bluff Lake. Ironically, the nest tree had died the previous fall from a beetle infestation, yet the birds continued to use the tree through spring 2011. In 2012, that pair constructed another nest within the same woodpecker cluster in sight of the old nest tree. A second nesting pair of eagles was discovered in 2011 within a lone loblolly pine along the northern edge of the Jones Creek Unit’s Prisock field moist-soil complex. Wintering and migrating eagles continue to utilize the refuge beginning in November and staying through March.

---

Golden eagles were recently documented utilizing the refuge. During the winter of 2012-2013, Mississippi State University (MSU) and the refuge partnered to place a trail camera with baited deer carcasses during the months of January and February for a nationwide golden eagle monitoring effort. The first documented sighting of a mature golden eagle was captured with this technology in January 2013 on Douglas Bluff Road. MSU personnel and the refuge plan to continue this monitoring effort for many years to gain a better understanding of golden eagle use east of the Mississippi River and to estimate population numbers of golden eagles within each area. Many of the eagles have unique identifying characteristics that allow researchers to identify individuals to get an accurate count number of eagles using an area. In December 2013, two golden eagles were photographed at a refuge monitoring station.

### *Forest Breeding Birds*

Like waterfowl, many species of forest breeding birds are experiencing long-term declines as a result of habitat losses across the full range of their breeding and migrating habitats in North America, as well as losses in their wintering habitats in Central and South America. However, the immediate causes of the decline are not clear, and evaluation of the problem is complicated by their intercontinental range and by the fact that this group of migratory species is composed of over 250 species occupying a number of different habitat guilds (USFWS 1995).

In contrast to wintering waterfowl, forest breeding birds and grassland songbirds which use the Noxubee River ecosystem are less able to shift habitat use from one type to another habitat type. Forest breeding birds can also be appreciably concentrated while breeding. Therefore, area-sensitive species, those associated with and seemingly requiring relatively large (20,000 acres or greater) blocks of habitat, have been most adversely impacted by habitat loss in the system. Examples include the swallow-tailed kite (*Elanoides forficatus*), cerulean warbler (*Setophaga cerulean*), Swainson's warbler (*Limnothlypis swainsonii*), Acadian flycatcher (*Empidonax virescens*), great-crested flycatcher (*Myiarchus crinitus*), wood thrush (*Hylocichla mustelina*), red-eyed vireo (*Vireo olivaceus*), and northern parula (*Setophaga Americana*).

Henslow's sparrows (*Ammodramus henslowii*) are small secretive birds which overwinter in the southeastern United States. These birds have general preferences for grassy pine flats and other moist grassland areas. Specifically, sites where they occur in Mississippi consist of open pine overstory with an understory dominated by grasses and sedges, similar to habitat requirements for our species of concern, the RCW (Chandler and Woodrey 1995). They will avoid habitat burned within 3 months, but also avoid habitat that has not been burned in over 5 years. On the refuge, these birds might be found in the managed RCW habitats that have successfully transitioned into mature pine savannahs, as well as at the Morgan Hill prairie demonstration area.

### *Waterfowl*

The number of waterfowl seen in the refuge's wetlands is abundant but has decreased since the 1960s and 1970s. Currently, 18 waterfowl species utilize the refuge and receive significant management attention. Mallards (*Anas platyrhynchos*), wood ducks (*Aix sponsa*), gadwall (*Anas strepera*), green-winged teal (*Anas carolinensis*), and ring-necked ducks (*Aythya collaris*) make up the bulk of the waterfowl found on the refuge, with population surveys peaking near 6,000 birds in winter months; these surveys cover approximately 50 percent of the available habitat.

---

Wood ducks are the most numerous waterfowl species found on the refuge on a year-round basis; their numbers peak during winter migration. Mallards, wood ducks, and ring-necked ducks still comprise the majority of all wintering waterfowl species on the refuge. Spring and fall flights of blue-winged and green-winged teal appear to have remained rather constant from old reports and casual observations made today.

Waterfowl numbers have declined over the past several decades on the refuge. The reasons may be multifaceted and complex, but many experts believe that habitat improvements throughout the surrounding landscape have contributed to decreased numbers on refuge. Although waterfowl numbers may have changed, species composition appears to be similar. Migratory waterfowl have many specific habitat requirements and energy needs. On reaching the wintering grounds, not only do waterfowl need reliable water but also food resources on which they can restore fat reserves prior to returning to the wintering grounds.

Bottomland hardwood forests are essential to wintering waterfowl. Waterfowl are influenced by four components within bottomland hardwood wetlands: herbaceous vegetation, woody vegetation, forest litter, and macroinvertebrates (Fredrickson and Batema 1992). These natural wetlands are critical foraging and resting habitats. Both hardwood bottomlands and moist-soil habitats are rich in high-energy natural seeds (e.g., acorns in oak bottomlands; grass-sedge seeds, roots, and tubers in moist-soil areas) and aquatic invertebrates (Kaminski et al. 2003, Heitmeyer 1988-2006). Aside from food resources, forested wetlands are vital to waterfowl for pair bonding, loafing, sanctuary, thermal cover, and feeding (Reinecke et al. 1989). Trees also provide roosting and nesting sites for breeding wood ducks. Trees and scrub-shrub vegetation provide cover for brood rearing. Several species of waterfowl heavily utilize flooded forested habitat in winter for resting and foraging for acorns, other fruits, various seeds, and invertebrates. Wood ducks seek these bottomland habitats almost exclusive of other habitats. Mallards, gadwall, and wigeon all utilize flooded forested habitat as one of the complex of preferred habitats (Fredrickson and Heitmeyer 1988). Breeding wood ducks preferred habitats include forested wetlands, wooded and shrub swamps, tree-lined rivers, streams, sloughs, and beaver ponds. Wood ducks are cavity nesters, seeking cavities in trees within a mile of water. Brood survival is higher in situations where nests are close to water. Adequate brood habitat can seriously affect duckling survival and reproductive success. McGilvrey (1968) described preferred brood habitat as 30 to 50 percent shrubs, 40 to 70 percent herbaceous emergent, and 25 percent open water. Overhead cover within 1 to 2 feet of the water surface is vital for wood duck broods. Optimum habitat should have 75 percent cover and 25 percent open water, with a minimum of 1/3 cover to 2/3's open water. Ducks like openings in the woods to allow them easy access.

Flooded agricultural fields coupled with moist-soil management can provide important wildlife habitat (Tirpak et al. 2009), and use of agricultural crops lessen the number of acres of moist soil and flooded GTR habitat required yearly. Agricultural crops can provide high-energy food resources for waterfowl. Annual agricultural practices can also increase the productivity of moist-soil units by stimulating the growth of desirable plants. Crops preferred by waterfowl include corn, rice, milo, millet, wheat, soybeans, and buckwheat.

The primary value of scrub-shrub habitats to waterfowl is by providing thermal roosting cover and protection from avian predators (U.S. Fish and Wildlife Service 2007a). Scrub-shrub wetlands are created by beaver, storm damage, and hydrological changes within lakes. These areas are typified by willows, buttonbush, other woody species, and perennial herbaceous vegetation. The decaying leaves provide substrate for invertebrates, which, in turn, provides food for waterfowl.

An additional essential component of waterfowl wintering habitat complexity is sanctuary from human disturbance. Winter is a biological preparatory period during which many ducks and geese pair and

---

perform other life functions (e.g., females of some species [mallard] undergo a prebasic molt to acquire their breeding-season plumage) in readiness for reproduction. Disturbance-free habitat enables some species of waterfowl to prepare biologically for spring migration and reproduction (Reinecke et al. 1989, Strickland et al. 2009). Disturbance can interrupt resting and feeding bouts resulting in a loss of energy and lowering of body weight (Henry 1980; Heitmeyer and Raveling 1988; Kahl 1991). Paulus (1984) found in Louisiana that increased foraging time by gadwalls was insufficient to counterbalance disturbance factors.

### *Shorebirds*

Although shorebirds are not plentiful on the refuge, several species have been documented to occur here, including black-neck stilt (*Himantopus mexicanus king*), Wilson's snipe (*Gallinago delicata*), and yellowlegs (*Tringa spp.*). Shorebirds utilize a variety of habitat types such as mudflats, shorelines, an array of freshwater wetlands (with water depths less than eight inches), and dry grasslands for foraging. Roosting sites are primarily limited to shallowly flooded areas free of vegetation (Helmers 1993). Shorebirds feed predominately on invertebrates, aquatic or semi-aquatic. To maximize biomass of these prey species, standing water or completely saturated soil must be present for a sufficient period for their populations to develop. Generally, optimal prey biomass can be attained by flooding one month prior to the arrival of shorebirds.

Different species of shorebirds utilize different habitats primarily dependent upon water depth and vegetation height and density. Water depths range from 0 inches (dry mud) to 8 inches. Vegetation density ranges from no cover to 75 percent cover. However, the majority of use occurs at sites with less than 25 percent cover. Shorebirds generally utilize sites where vegetation is less than half the height of the bird, but some species will forage in taller vegetation.

Spring migration for shorebirds in this area is from March to early June and peaks from mid-April to mid-May, and fall migration is from late June to October and peaks in September. During migration, the most important consideration for shorebirds is finding sites to obtain energy for fuel during the next leg of the flight. Efforts have been made within existing moist-soil areas to provide suitable shorebird habitats on the refuge during the spring migration.

### *Wading Birds*

Large numbers of wading birds are present on the refuge, including wood storks, great and little blue herons (*Ardea Herodias* and *Egretta caerulea*), little green herons (*Butorides virescens*), great and snowy egrets (*Ardea alba* and *Egretta thula*), and a large nesting colony of cattle egrets. Two rookeries have established on the refuge—one contains more than 10,000 breeding pairs of cattle egrets and 3,000 pairs of snowy egrets, little blue herons, and white ibis. The other rookery contains several hundred pairs of great blue herons and great egrets.

Wading birds utilize the wetland areas found throughout the refuge. The birds can be seen within the bottomland forest, in the moist-soil units and on any of the bodies of water found on the refuge. Many of the birds use the refuge for roosting sites and fly upwards of 40 miles to forage during the day.

### *Bats*

The Rafinesque's big-eared bat is the least-studied bat in the eastern United States and is federally designated as a species of special management concern. Though widespread in the eastern United States (southern Virginia south and west to eastern Texas and northward along the Mississippi River valley into southern Indiana), this bat is not abundant. Its range most closely approximates the

---

historical range of great cypress swamps, indicating that it may have formed a traditional reliance on these areas as roosting and foraging sites. However, population levels appear to have declined in the past century due to loss of summer roosting or foraging habitats and disturbance at winter hibernacula (Bat Conservation International).

Rafinesque's big-eared bats are slow, agile flyers and appear to forage on a wide variety of small, nocturnal insects, especially moths. They hibernate near their summer foraging grounds in old mines, caves, hollow trees, and cisterns. They are known to form nursery colonies in large hollow trees that provide stable internal environments, protection from predators, and often contain well-insulated areas that form the hot-air traps essential for rearing young. However, loss of traditional habitats has resulted in use of old buildings, abandoned houses, and attics as maternity roosts.

The southeastern myotis is a species of bat associated with riparian areas or bottomland hardwoods and is listed as a federal species of special management concern due to declining populations. Southeastern myotis bats roost in caves in the northern part of their range, but utilize cavity trees (along with Rafinesque's big-eared bats) in areas where caves are not available. They typically roost in clusters of several to a few hundred or more individuals. They are thought to forage primarily over lakes, ponds, and slow-moving streams, flying close to the water's surface. This species is unique in that it normally bears twins instead of a single young. Young take two to three weeks longer to develop than most other bats.

In Mississippi this species can be found throughout the year, hibernating and roosting in cavity trees, often in association with Rafinesque's big-eared bats. Both, the southeastern myotis bat and Rafinesque's big-eared bat have been documented on the refuge. Southeastern myotis bats can be captured in mist nets and are acoustically detected more than their cavity partners, the Rafinesque's big-eared bats. Rafinesque big-eared bats are difficult to capture using mist nets, though some individuals have been documented within opportunistic mist net events. They are equally difficult to detect using acoustical survey methods due to the extremely soft echolocation call that this particular species emits. Cavity trees for use by these species do not appear to be limited on the refuge (Stevenson 2008).

### *Raptors*

Common raptors include red-shouldered hawk (*Buteo lineatus*), Cooper's hawk (*Accipiter cooperii*), red-tailed hawk (*Buteo jamaicensis*), and sharp-shinned hawks (*Accipiter striatus*); barred owls (*Strix varia*); both black and turkey vultures (*Coragyps atratus* and *Cathartes aura*); bald eagles; and occasionally Mississippi kites (*Ictinia mississippiensis*). Golden eagles as well as peregrine falcons (*Falco peregrinus*) are occasionally spotted on the refuge and have been documented. These species use a variety of habitats available on the refuge to provide food, cover, and nesting sites.

### *OTHER WILDLIFE SPECIES*

Although the refuge was established for the purpose of providing habitat for the benefit of particular migratory bird species (i.e., waterfowl), in more recent years, the refuge has expanded its focus to embrace all species of migratory birds while also attempting to provide ancillary benefits for resident bird species.

---

### *Other Birds*

Northern bobwhite populations are determined by habitat conditions. The amount, quality, and availability of food and nesting areas affect population levels. Bobwhites utilize habitats comprised of native grasses, forbs, and shrubs. They are frequently found in forest openings and open woods which are also favored by RCW. Northern bobwhites (*Colinus virginianus*) are widely distributed eastern game birds favoring fire-maintained early successional habitats (Brennan 1999). Examples of habitat providing high-quality forage for these birds include fields, grasslands, and open, park-like pine habitats. Northern bobwhites primarily consume seeds and leaves of herbaceous plants; therefore, acreage being converted from mixed pine/hardwood stands to more open, park-like stands with herbaceous seed-bearing plants as the dominant understory should elicit positive responses from the Northern bobwhite. In fact, research conducted at the refuge has shown that management for RCW through the reduction of forest basal areal and the increased burning regimen increased the northern bobwhite's preference for these habitats (Fuller 1994).

### *Mammals*

The refuge is home to 47 mammal species including the most common: white-tailed deer, beavers, gray, ground, fox, and southern flying squirrels (*Sciurus carolinensis*, *S. niger*, and *Glaucomys volans*), swamp and eastern cottontail rabbits (*Sylvilagus aquaticus* and *S. floridanus*), grey and red foxes (*Urocyon cinereoargenteus* and *Vulpes vulpes*), coyotes (*Canis latrans*), skunks (*Mephitidae* spp.), opossum (*Didelphimorphia* spp. ), raccoon (*Procyon lotor*), and several species of small rodents, such as mice, rats, and voles. One of the most diverse groups of mammals is bats, with seven species likely to occur on the refuge. Hunting and wildlife watching of game species of mammals, especially white-tailed deer, continue to be a popular draw for visitor use on the refuge.

### *Reptiles*

Numerous reptile species are known to occur on the refuge and the largest and most notable is the American alligator. The most common snakes are black racers (*Coluber constrictor*), gray ratsnake (*Pantherophis spiloides*), western cottonmouths (*Akistodon piscivorus*), and several species of water snakes. Common lizards include four species of skinks, Carolina anoles (*Anolis carolinensis*), and eastern fence lizards (*Sceloporus undulatus*). Turtle species include red-eared sliders (*Trachemys scripta*), river cooters (*Pseudemys concinna*), common and alligator snapping turtles (*Chelydra serpentine* and *Macrochelys temminckii*), and three-toed box turtles (*Terrapene carolina*).

### *Insects*

Insects make up the bulk of the biodiversity on the refuge with more species of insects being present than all vertebrates and plants combined. However, little is known about insect populations on the refuge because the basic biology, habitat requirements, population dynamics, and distribution are incompletely or poorly understood.

During the past 30 years, researchers from the Mississippi Entomological Museum at MSU have been studying insects at the refuge as part of a regional survey effort. Recently, intensive surveys have been conducted to document the diversity of ants (Hymenoptera: Formicidae) (MacGown et al. 2012) and long-horned beetles (Coleoptera: Cerambycidae) (Schiefer, in preparation) on the refuge. Consequently, it is believed that the refuge has a great diversity of xylophagous (wood feeding) and

---

saproxylic (associated with dead wood) insects, especially beetles. The various species of these insects segregate themselves in the forest by microhabitats that depend on tree species, tissue type, position of the tree, stage of decomposition, and other factors. The bottomland and upland hardwood forests are particularly diverse in saproxylic insects, but the pine forests have their own unique fauna as well. These insects are dependent on the quality and quantity of dead wood in the forest, and they decline in diversity in the intensively managed forests found in much of the southeastern United States.

Since 1987, a butterfly count has been conducted annually on the refuge as part of the North American Butterfly Association's count program. The species diversity recorded on the count is usually among the highest for counts conducted in the eastern United States, which is reflective of the habitat diversity within the count circle and on the refuge.

Although many common species of insects at the refuge can be shown to be secure, many other species are infrequently encountered. It is usually difficult to determine if these rarely encountered species are truly rare and declining or just rarely collected due to some aspect of their biology. There are no federally threatened or endangered insects found at the refuge.

#### *Plants*

No federally threatened or endangered plants are known to exist on the refuge. Several floristic surveys have been conducted on the refuge. Two surveys were conducted in order to locate Price's potato-bean. No Price's potato-bean plants or indicator species and habitat frequently associated with Price's potato-bean were found on the refuge (Warren per comm). Additional surveys did locate blackfoot quillwort, a state-listed critically imperiled species, on the refuge south of Dorman Lake Road and south of Dummy Line Road (MacDonald per comm). To assure that proposed management activities did not contribute to the loss of any of these plants, buffers were established to protect the plants and habitats. If a federally threatened or endangered plant is identified on the refuge, immediate steps will be taken to protect the plant and meet its management needs. This plan will be updated to reflect this discovery and list the plant as a resource of concern. When state-listed critically imperiled species are identified on the refuge, steps, such as buffer zones, will be taken to minimize the impact of wildlife habitat manipulations.

### AQUATIC BIOTA

#### *Paddlefish*

Paddlefish were once common throughout much of the Mississippi River Basin and adjacent Gulf drainages. Losses of spawning and rearing habitat resulting from channelization and dam construction have contributed to the decline of paddlefish stock in certain river systems. The unique foraging characteristic of the fish (plankton filter feeder) makes paddlefish habitat restricted in many river systems. Early larval growth also depends on high concentrations of plankton. Adult fish locate selective spawning sites generally consisting of silt-free gravel, sand, or cobble bottoms that have relatively fast-flowing water during the breeding season. These sites are limited in most river systems. Movements between spawning sites and non-breeding locations can exceed 50 miles. Physical barriers in major rivers have drastically altered the natural movements of these fish and isolated small populations (Ross et al. 2001).

Within the middle Tennessee-Tombigbee River waterway, the species has a relatively isolated population inhabiting the Demopolis Pool and portions of the Noxubee River which provide the only deeper water to support this fishery. Paddlefish appear to be attracted to the outflow water control

---

structure of Bluff Lake and Halbert Lake located to the east of the lake. This area may provide suitable spawning areas due to site and waterflow characteristics.

#### *Gulf Coast Walleye*

Gulf Coast walleyes are native to the Deep South and range from Mississippi to northern Georgia. Once abundant in suitable habitats, this species declined in much of the Mobile Basin in the 1970s and early 1980s during construction of the Tennessee-Tombigbee Waterway. This project connected the Tennessee River with the Tombigbee watershed through a 234-mile network of navigation channels, locks, and dams. This project drastically changed walleye habitat by altering flow rates, changing siltation rates, and structurally modifying habitats. These changes are thought to have greatly reduced spawning success throughout the system. Areas of the Noxubee River may play an important role in the conservation of this species, with the refuge providing favorable spawning habitats.

#### *Amphibians*

Numerous species of amphibians are known to occur on the refuge. The largest is the three-toed amphiuma (*Amphiuma tridactylum*). Several species of salamanders, including the marbled and slimy (*Ambystoma opacum* and *Plethodon glutinosus*) salamander, are commonly seen. Frogs and toads such as Spring peepers (*Pseudacris crucifer*), American bullfrog (*Rana catesbeiana*), green tree frog (*Hyla cinerea*), bird-voiced tree frog (*Hyla avivoca*), gray tree frog (*Hyla versicolor*), and Fowler's toad (*Bufo fowleri*) are common on the refuge.

#### *Fish*

Bluff Lake, Loakfoma Lake, Ross Branch Reservoir, and the Noxubee River harbor 25 species of fish, of which five are primary game species. Popular game fish include several species of catfish, largemouth bass, black and white crappie, bream, red-ear sunfish (*Lepomis microlophus*), and bluegill (*Lepomis macrochirus*). Nongame fish include common carp, bowfin (*Amia calva*), and several species of shiners and darters. Many of these fish species are important food sources for wading birds and resident wildlife on the refuge.

### **CULTURAL RESOURCES**

The body of federal historic preservation law has grown dramatically since the enactment of the Antiquities Act of 1906. Several themes recur in these laws, their promulgating regulations, and more recent executive orders. They include:

- each agency is to systematically inventory the historic properties on their holdings and to scientifically assess each property's eligibility for the National Register of Historic Places;
- federal agencies are to consider the impacts to cultural resources during the agencies' management activities and seek to avoid or mitigate adverse impacts;
- the protection of cultural resources from looting and vandalism are to be accomplished through a mix of informed management, law enforcement efforts, and public education; and
- the increasing role of consultation with groups, such as Native American tribes, in addressing how a project or management activity may impact specific archaeological sites and landscapes deemed important to those groups.

---

The Service, like other federal agencies, is legally mandated to inventory, assess, and protect cultural resources located on those lands that the agency owns, manages, or controls. The Service's cultural resource policy is delineated in 614 FW 1-5 and 126 FW 1-3. In the Service's Southeast Region, the cultural resource review and compliance process are initiated by contacting the Regional Historic Preservation Officer/Regional Archaeologist (RHPO/RA). The RHPO/RA will determine whether the proposed undertaking has the potential to impact cultural resources, identify the "area of potential effect," determine the appropriate level of scientific investigation necessary to ensure legal compliance, and initiate consultation with the pertinent State Historic Preservation Office (SHPO) and federally recognized tribes.

For compliance with Section 106 of the National Historic Preservation Act of 1966, the refuge staff will provide the regional historic preservation officer a description and location of all projects, activities, routine maintenance, and operations that affect ground and structures. Details on requests will be provided along with a range of alternatives considered. That office will analyze those undertakings for their potential to affect historic and prehistoric sites, and consult with the State Historic Preservation Officer and other parties as appropriate. The staff will notify the state, tribes, and local government officials to identify concerns about the impacts of those undertakings.

Past archaeological investigations at the refuge have been mostly limited to compliance surveys prior to construction projects and land exchanges. A variety of resources has been discovered, ranging from relics of early Native-American settlements to more recent sites where farm houses and other structures were located at the time the refuge was established. The earliest known site was located by Dr. Janet Rafferty, and produced artifacts dating to the early Archaic period (ca. 9000-7000 B.C.). Another well-studied site dates back to the Gulf Formation through Miller periods (ca. 1000 B.C.), with artifacts consisting of ceramic shards, projectile points, drill bits, hammerstones, and fire-cracked rocks. Numerous other Native-American sites occur throughout the refuge, where projectile points and pottery shards are commonly found. However, none of these sites has been studied in detail. The refuge has two assets that were constructed greater than 50 years from present including the fire tower located at the Work Center and the Bluff Lake Levee. Both of these assets were originally constructed in the 1930's.

Although the Choctaw tribe is now the most prominent tribe in this part of Mississippi, the Choctaw culture did not form until after European contact, as remnants of other tribes, decimated by introduced diseases, came together to form a new political and ethnic body. All of the sites described above pre-date the Choctaw culture, and so far no sites have been discovered on the refuge which can definitely be assigned to the Choctaw tribe.

Evidence of Euro-American settlements is also abundant on the refuge. The oldest documented Euro-American site was located in 1997, during an archaeological survey conducted in preparation for the widening of State Highway 25. Named the Colclough Farmstead Site, and dating back to the late 1800s and early 1900s, it is considered representative of a middle class farmer. Features of the site included a smokehouse, root cellar, piers or posts of a house and several outbuildings, the remains of an animal pen, a bottle dump, and tire ruts. Artifacts recovered included cut and wire nails, handmade brick fragments, window glass, amethyst glass, whiteware, pearlware, salt- and alkaline-glazed stoneware shards, and bones of white-tailed deer and domestic pigs. Numerous other Euro-American sites are found on the refuge, including eleven cemeteries, six churches, four schools, four mill sites (sawmills and gristmills), and one diversion canal.

---

## SOCIOECONOMIC ENVIRONMENT

The refuge consists of 48,219 acres within the 61,715-acre approved acquisition boundary. Its northern boundary is about 5 miles south-southwest of Starkville, Mississippi, and about 12 miles west of Brooksville, Mississippi. The largest municipality and population center in the area is Columbus, Mississippi, about 35 miles to the northeast, in Lowndes County.

The region encompassing the refuge, often referred to as the Golden Triangle, is supported by an agricultural and timber economy. Much of the area is forested, and the forest products industry is vital to the region's local economy. Forestry is second only to farming as the largest industry in Mississippi. Manufacture of wood products also forms the second largest manufacturing sector in Mississippi. Most of the forest industry is based on privately owned forested land, which tends to be in smaller scattered parcels. Concurrently, the number of working farms is declining and the size of larger corporate farms is increasing regionally. While agricultural and timber products have always been a large component of the economy, beginning in the 1950s and continuing until the national recession in the 1980s, manufacturing became the primary source of employment and income for the area's population. Growth in this sector slowed somewhat during the late 1990s. Currently, value-added manufacturing is seen as the most promising field for economic development in the region.

The total population of the three counties in which the refuge is located is about 78,161 people, or only about 3 percent of the state's population, and grows at about 2.4 percent every 5 years (Table 2). The people in these counties typically are native to the state, have a per capita income of about \$16,000, with about 76 percent of persons over the age of 25 having high school diplomas (U.S. Department of Census 2011 Estimate).

**Table 2. Demographic characteristics for the local counties, Mississippi and the United States 2012**

Characteristic	Oktibbeha County	Noxubee County	Winston County	State of Mississippi	United States

## REFUGE ADMINISTRATION AND MANAGEMENT

### LAND PROTECTION AND CONSERVATION

Management policies of the refuge are designed to conserve, restore, and enhance in their natural ecosystems all imperiled animals and to manage for endemic habitats and species. Creating and maintaining habitat for the red-cockaded woodpecker, wood stork, waterfowl, and forest breeding birds are high-priority and high-visibility activities. The primary tools for management include managing forests and water level manipulation. Land acquisition is another tool used to conserve habitat for wildlife in perpetuity through the fee-title purchase of land from willing sellers. All of the lands acquired over the last few decades have been through timber-for-land exchanges. Timber-for-land exchanges do not require the use of appropriated funds for land acquisition.

### *Cooperative Farming*

Cooperative farming is the term used for cropping activities done by non-federal third parties on land that is owned by the refuge in fee title or controlled by the refuge through a restrictive easement. This type of activity is usually done on a short-term basis (3 years or less) to prepare an optimum seed bed for migratory bird species and native grassland species. Cropping was historically used on the refuge through a cooperative farming agreement issued by the refuge manager. Previously, the cooperative farming program at the refuge emphasized the production of soybeans and corn and the harvest of hay from the refuge fields. Cooperative farming is no longer practiced on the refuge.

### ECONOMY, RECREATION, AND TOURISM

The refuge plays an important role in the economy of local communities and the region. With annual visitation around 160,000 visits, the refuge is an important destination for people seeking recreational and educational opportunities, attracting local residents as well as tourists. Approximately one-third of these visitors participate in consumptive use activities such as hunting and fishing, while the other two-thirds are involved in nonconsumptive recreation (e.g., bird watching, sightseeing, hiking, and picnicking) or education. Most, if not all, utilize services provided by local vendors within the surrounding communities, thus infusing money into the local economy.

---

The economic contribution of outdoor recreation is very important statewide and its participants are increasing. Hunting, fishing, and other wildlife-related activities entice visitors to the refuge from many parts of Mississippi, the southeast region, and countries from throughout the world. With their high rates of economic growth, rural recreation counties represent one of the main rural success stories of recent years. During the 1990s, these places—whose amenities attract permanent residents as well as seasonal residents and tourists—averaged a 20 percent population growth, about three times that of other non-metropolitan counties, and 24 percent employment growth, more than double the rate of other non-metropolitan counties.

Mississippi's executive and legislative branches have recognized that travel and tourism are driving forces in the state's economic development efforts. Travel and tourism's visibility in Mississippi is at an all-time high. Fifty-five local entities with a travel and tourism component were in place as of February 2012. They include chambers of commerce, convention and visitor bureaus, tourism councils, economic development offices, commissions, cities, counties, and city/county partnerships. U.S. travel and tourism had \$759 billion in direct domestic and international expenditures with 7.4 million direct jobs, 6.8 million indirect and induced jobs, \$188.4 billion in payroll income, and \$117 billion in combined federal, state, and local tax revenues, and 2.7 percent of U.S. gross domestic product (gdp) (U.S. Travel Association, calendar year (CY) 2010).

By law (Refuge Revenue Sharing Act (16 U.S.C. 715s)), the refuge is exempt from paying property tax and instead makes revenue sharing payments to the three counties in which the refuge is located: Oktibbeha, Noxubee, and Winston (Table 3). The law provides a method of collecting monetary receipts from revenue generating activities (e.g., timber harvest revenue, commercial activities) on refuges within the nation, pooling them together, and paying them out to counties containing refuge lands. Payment for acquired land is computed on whichever of the following formulas is greatest: (1) three-fourths of one percent of the fair market value of the lands acquired in fee title; (2) 25 percent of the net refuge receipts collected; or (3) 75 cents per acre of the lands acquired in fee title within the county. If the receipts generated on refuges do not meet the entitlement amount, Congress may approve additional funds to make up the shortfall.

**Table 3. Revenue sharing payments, 2007-2012**

	<b>Year</b>					
<b>County</b>	<b>2007</b>	<b>2008</b>	<b>2009</b>	<b>2010</b>	<b>2011</b>	<b>2012</b>
Noxubee	\$73,460	\$56,994	\$53,556	\$47,840	\$51,264	\$51,264
Oktibbeha	\$128,302	\$89,307	\$81,836	\$72,363	\$77,542	\$77,542
Winston	\$163,106	\$126,546	\$181,911	\$65,016	\$69,670	\$69,670

## VISITOR SERVICES

Sam D. Hamilton Noxubee NWR strives to have an excellent reputation as a steward of public lands. The refuge has created education and visitor service programs that give the public an opportunity to learn about and enjoy fish and wildlife resources. In fact, education and recreation are playing key roles in assisting the refuge to integrate biodiversity education and recreation programs, such as hunting and environmental education. Consistent with the provisions outlined in the National Wildlife Refuge System Improvement Act of 1997, the Service provides recreation opportunities that reflect the unique qualities and features of national wildlife refuges. Refuge programs provide the public with an opportunity to learn about, enjoy, and appreciate fish and wildlife.

---

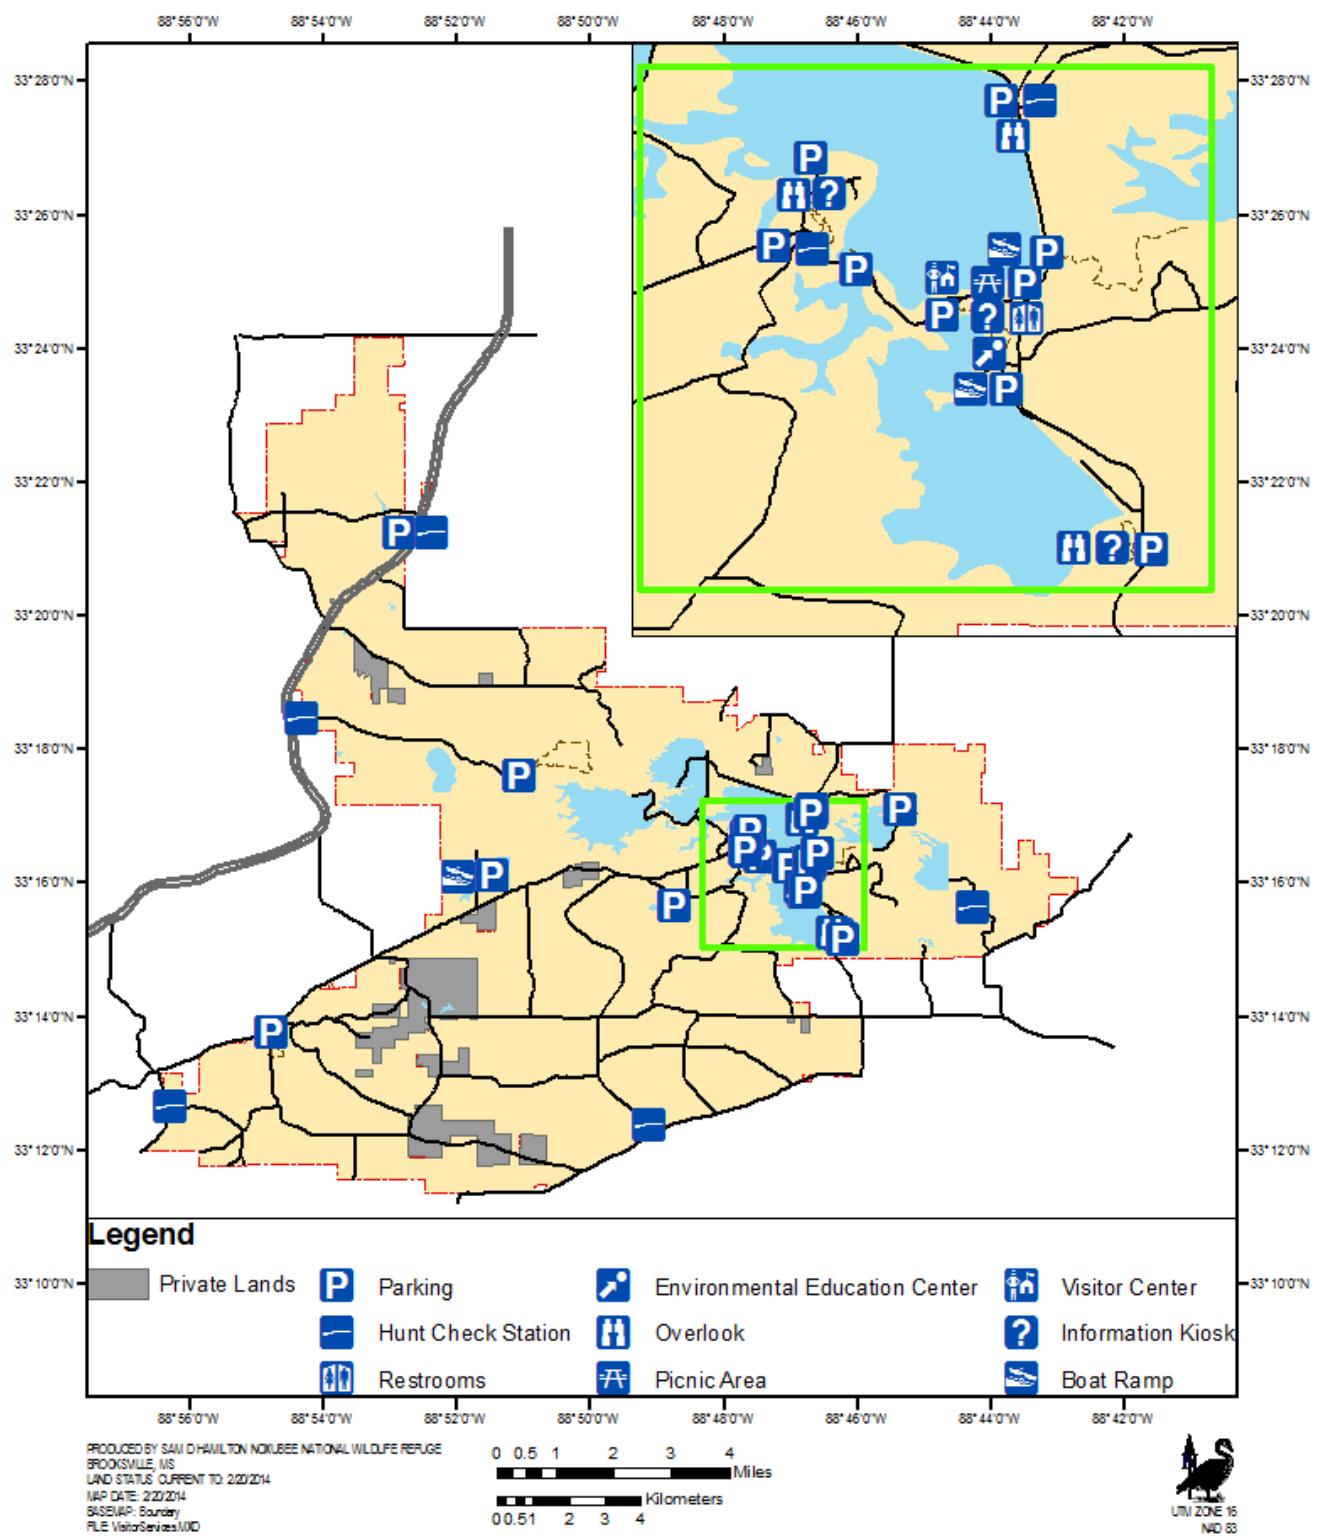

The refuge has more than 160,000 visits annually (based on 2012 RAPP database; U.S. Fish and Wildlife Service, 2011, written comm.). Visitors participate in a variety of activities including fishing, waterfowl hunting, upland game hunting, big game hunting, use of the visitor center, hiking, motorized and non-motorized boating, bird watching, wildlife photography, wildlife observation, environmental education, and research. The refuge serves as an outdoor classroom for MSU, Starkville School District, and other local educational institutions. For more information, please visit <http://www.fws.gov/noxubee/>.

*Existing public amenities include:*

• <i>Sam D. Hamilton Noxubee Visitor Center</i>	• <i>Four Informational Kiosks</i>
• <i>Public Restrooms</i>	• <i>Multiple Parking Areas</i>
• <i>Bluff Lake Boardwalk</i>	• <i>Four Informational Kiosks</i>
• <i>Bluff Lake Boat Ramp and Parking Area</i>	• <i>Multiple Parking Areas</i>
• <i>Three Non-motorized or Limited Access Boat Ramps</i>	• <i>Loakfoma Boat Ramp</i>
• <i>Goose Overlook</i>	• <i>Seven Hunter Check Stations</i>
• <i>Loakfoma Lake Overlook/Tower</i>	• <i>Woodpecker Trail</i>
• <i>Loakfoma Lake Handicapped Fishing Jetty</i>	• <i>Ray Watson Memorial Trail</i>
• <i>Morgan Hill Overlook</i>	• <i>Beaver Dam Trail</i>
• <i>Morgan Hill Prairie Trail</i>	• <i>Scattertown Trail</i>
• <i>Webster Memorial</i>	• <i>Craig Pond Trail</i>

---

## *Public Access*

The refuge provides ample access suitable for the majority of public users (Figure 12). There are five boat ramps (two improved concrete and three graveled) on Bluff, Loakfoma, and Ross Branch lakes that are maintained by refuge staff. Historically, peak use of the refuge occurred during the refuge's spring fishing and fall hunting seasons, but nonconsumptive use is increasing throughout the year. At this time, the refuge maintains 61 miles of graveled and 17 miles of asphalted roads, as identified in the Federal Highways Refuge Roads Inventory. Numerous roads are open to the public and provide ample access opportunities to hunt, fish, and observe and photograph wildlife, allowing access to boardwalks, trailheads, and overlooks. With recent upgrades in key refuge access roads, commercial and pass-through traffic is on the increase along with a general increase in traffic speeds and volume. Additional increases are anticipated as the State of Mississippi recently established Mississippi's Noxubee Hills Scenic Byway, which includes the improved refuge roads as part of its designated route. Use of refuge graveled roads by the commercial trucks is also increasing as these vehicles take advantage of shorter routes through the refuge. The increase in traffic volume and use by high weight vehicles is increasing maintenance costs and higher traffic speeds are causing increasing observations of vehicle accidents and wildlife mortality.

Most of the refuge's public use facilities, including trails, buildings, maintenance facilities, employee housing areas, parking areas, boat ramps, and restrooms, are maintained in the area around Bluff and Loakfoma lakes. Other than graveled roads, roadway gates, one walking trail at Bevill's Hill, and kiosks, few other developed assets exist on the refuge.

## *Hunting*

The refuge offers the public a wide range of hunting opportunities including seasons for archery, primitive weapon and modern gun, as well as special opportunities for youth and mobility impaired hunters. The refuge is visited by hunters living throughout the southeast to participate in a quality white-tailed deer hunting experience, as well as waterfowl hunting in the flooded bottomland forests. Deer and squirrel hunting remain the most popular public hunting opportunities, followed by waterfowl, turkey, and furbearers. In addition to these hunting seasons, hunters have the opportunity to harvest beaver, nutria, and feral hog (*Sus scrofa*) incidental to any hunt with weapons that are legal for that particular hunt.

Gun deer hunting on the refuge is implemented through a quota permit system offering up to 2,000 permits with a designed target harvest of up to 500 deer. There is a \$15 fee for deer hunting permits. The annual refuge deer harvest averages an estimated 430 deer annually.

Currently, waterfowl hunting occurs on each Wednesday and Saturday mornings of the state season. There is a \$15 quota hunt fee collected for each application and the hunt operates under a refuge-drawn permit system. For each hunt day, up to 12 permitted waterfowl hunters and their two additional guests can hunt waterfowl within a designated hunting location. All waterfowl hunting closes each day at 12 p.m. and all hunters must exit the area by 1 p.m. Hunters not successful in the draw have the opportunity to hunt as standby hunters on any of the days open to waterfowl hunting at no additional cost.

Furbearer hunting for raccoon (*Procyon lotor*) and Virginia opossums (*Didelphis virginiana*) with dogs is only allowed from sunset to sunrise. Prohibiting the use of catch dogs during daylight hours helps minimize conflicts between furbearer hunters and other hunters. Fields trials for both raccoon and

---

squirrel dogs are allowed under a special use permit and associated fee of \$50. The use of dogs is authorized for waterfowl, squirrel, quail, woodcock, and rabbit hunting during daylight hours only.

The refuge currently uses a web-based permitting and quota hunt draw system. Hunters may now apply for the quota waterfowl hunts or purchase deer permits by going to the refuge website at <http://www.fws.gov/noxubee/>. Hunters can also visit the refuge visitor center or pick up an application that can be sent in with a check or money order. Permit fees are non-refundable and non-transferable. Permits must be signed and in possession of the sportsman at all times while hunting. Fishing and hunting of squirrel, turkey, rabbit, quail, woodcock, raccoon, and opossum remain free of fee, but still need a state license. The refuge does require all sportsmen to have the signed Hunting, Fishing, and Public Use brochure that is available for free at the Refuge Visitor Center, kiosks, or downloadable from the refuge's website. The refuge's regulations are structured to provide sportsmen with quality hunting opportunities while also providing safe public use opportunities for other user groups.

#### *White-tailed Deer*

As noted earlier, white-tailed deer hunting is a very popular activity on the refuge. The refuge hosted its first deer hunts in 1949. The number of deer harvested from 2002-2011 is shown in Table 4. With recent reductions in staffing levels, the refuge relies on self-clearing check stations for harvest information.

**Table 4. Number of buck and doe deer harvested on Sam D. Hamilton Noxubee NWR, 2002-2011**

	2011	2010	2009	2008	2007	2006	2005	2004	2003	2002	AVG
<b>Total Deer</b>	283	356	447	580	546	431	550	311	553	349	441
Bucks	116	152	236	334	330	250	290	155	380	180	242
Does	167	204	211	246	216	181	260	156	173	169	198

#### *Furbearers*

Furbearers include the opossum, raccoon, striped skunk (*Mephitis mephitis*), river otter (*Lontra canadensis*), beaver, mink (*Neovison vison*), muskrat (*Ondatra zibethicus*), nutria, red fox, gray fox, coyote, and bobcat (*Lynx rufus*). Hunting effort for furbearers has remained relatively steady over the years. At this time, no data are available on the actual numbers harvested. There is no public trapping season on the refuge.

#### *Squirrels*

Squirrel hunting has been the most popular small game hunted on the refuge since first offered in 1949. Hunting seasons for these species run concurrent with state seasons. At this time, no data are available on the actual numbers harvested.

---

### *Rabbits*

The refuge has both swamp and cottontail rabbits but their population numbers are low. Hunting seasons for these species run concurrent with state seasons. At this time, no data are available on the actual numbers harvested.

### *Turkey Hunt*

Each year, numerous hunters pursue turkeys during the spring (gobbler) hunt. The refuge is open for turkey hunting concurrent with the statewide season. At this time, no data are available on the actual numbers harvested.

### *Fishing*

Fishing on Bluff Lake is open March 1 – November 30 in conjunction with Mississippi fishing regulations (including size restrictions and limits). The Noxubee River and the borrow pits along Highway 25 are open year-round for fishing.

The refuge currently has two lakes (Bluff and Loakfoma), one reservoir (Ross Branch), several smaller ponds, and one river (Noxubee) that offer reliable fishing opportunities. Anglers have opportunities to catch largemouth bass, crappie, catfish, and sunfish. The popular species pursued by sport anglers have not changed over time: crappie, black bass (largemouth and spotted), bluegill, redear sunfish, and catfish. The refuge sponsors an annual youth fishing derby for the general public that continues to be popular with local residents and a second special event youth fishing derby for the Palmer Home for Children.

Fishing had become a popular sport on the refuge but angler numbers have been on the decline lately similar to many outdoor recreational activities in the past decade. Recreational fishing opportunities on the refuge are negatively impacted seasonally with the management of lakes for waterfowl and wood storks. Water levels are reduced during summer to allow for the growth of moist-soil plants used as food by ducks and to create shallow isolated water pools that trap fish as a food source for the summering wood storks.

### *Wildlife Observation and Wildlife Photography*

A large variety of wildlife can be observed on the refuge. There are many clusters of the endangered RCW. The American alligator is one of the most sought-after species among wildlife observers and photographers. Spotting an alligator is generally a matter of being in the right place at the right time. Birds within the refuge's breeding rookeries are also a draw for wildlife observers and photographers.

### *Environmental Education and Outreach*

The Larry Box Environmental Education Center is a partnership between the Starkville Mississippi School District and the refuge. The education center is located on the refuge and staffed by the Starkville School District. As part of the center's efforts, the refuge has partnered with educators at the Starkville School District to offer several curriculum-based environmental education programs, ranging from animal adaptations to habitat management, for approximately 5,000 students each year.

---

The Education Center offers visiting school groups a variety of equipment to use during their visit: binoculars, dip nets, bug boxes, microscopes, forestry supplies, waterfowl banding equipment, etc. School groups enjoy the use of the classroom in the refuge's Environmental Education Center, displays within the refuge's visitor center and the exhibit area, and the outdoor area located near Douglas Bluff.

#### *Interpretation*

Bottomland hardwood ecology, forest disturbance, animal adaptations, species interdependence, the Refuge System, red-cockaded woodpecker habitat, and refuge management are the primary themes and messages currently interpreted on the refuge. These themes and messages help visitors understand the key resource issues related to the Service, the Refuge System, and the refuge.

#### *Volunteers and Partners*

The refuge has an increasing number of volunteers providing important assistance to the refuge that ranges from helping at special events to resident volunteers staying at the refuge. Total volunteer hours average more than 12,000 hours per year and equates to about 6 full-time employees. Volunteer recruitment is an ongoing effort and all new volunteers receive appropriate orientation and training prior to work assignments. The refuge's remote rural location could be a limiting factor with regard to the number of available volunteers who possess the time, interest, and skills to assist on the refuge, but the close proximity of MSU and the importance of the refuge to the community play an important role as well.

Community partners include MSU, Friends of Noxubee, resident volunteers, Mississippi State Fish, Wildlife, and Parks, USDA Forest Service, Wild Turkey Federation, Ducks Unlimited, Bass Pro Shops, Audubon Society, and the Jena Band of the Choctaw Tribe.

#### *Friends Group*

The Friends of Noxubee Refuge group was established in May 2003. There are approximately 55 charter members who have assisted the refuge in the past with projects including: annual children's fishing derby, canoe day excursion on Bluff Lake, manning the Office/Visitor's Center, bluebird workshop, monitoring of the RCW clusters, other bird surveys, and the hosting of the Association of Retired Faculty of MSU. The Friends group has a quarterly newsletter to help keep members up to date on current and future projects and programs associated with the refuge. The group also manages a nature store inside the visitor's center and all proceeds go to support the refuge. Anyone in the public can join the group, with more information being available at the group's website (<http://www.friends-of-noxubee-refuge.org/>).

### ***PERSONNEL, OPERATIONS, AND MAINTENANCE***

#### *Personnel*

The refuge is currently funded for nine employees on its organizational chart. One of these nine positions is now vacant. The refuge staff receives substantial assistance from volunteers, Americore, college student interns, and youth conservation corps enrollees. The refuge has an important management partnership with the Starkville School District, providing environmental education and interpretation for local youth at the Larry Box Environmental Education Center. The refuge and MSU

---

also have an active partnership. University students and faculty contribute many hours towards conducting investigations and research projects on the refuge.

#### *Operations and Maintenance*

Each man-made feature on the refuge that requires operating and maintenance is considered an asset within the Service Asset and Maintenance Management System (SAMMS). At the current time the refuge has 308 assets listed within this system with a total replacement cost of approximately \$140 million. Annual maintenance costs are estimated at approximately \$485,000. In Fiscal Year 2013, the refuge received \$166,670 in maintenance funding. At the time of the writing of the 2004 Comprehensive Conservation Plan, the refuge staff consisted of 17 individuals and proposed at that time to increase the staff by an additional 14 members. Today, in fiscal year 2014, the refuge received funding for nine positions, showing a net loss of eight positions since the completion of the 2004 plan. At the current time, there are no immediate expectations of budget increases and instead the refuge may see a budget decrease with a need for further reduction of staff. Within the life span of this document, however, some level of increase is possible, and therefore some optimism is designed into the strategies. Regardless, priorities will need to be scaled to match the staffing levels, financial conditions, and level of support obtained through use of volunteers and partnerships. Administrative actions tied to the refuge's purposes will be kept in the position of highest priority followed by wildlife-dependent public use activities. Activities that cannot be considered wildlife-dependent will be terminated.

The refuge allows the public to use designated roads only. Most of the refuge's public use facilities, including trails, buildings, maintenance facilities, employee housing areas, parking areas, boat ramps, and restrooms, are maintained in the area around Bluff and Loakfoma lakes. Other than graveled roads, roadway gates, one walking trail at Bevill's Hill, and kiosks, few other developed assets exist on the refuge.

---

### *III. Plan Development*

#### **PUBLIC INVOLVEMENT AND THE PLANNING PROCESS**

In accordance with Service guidelines and the requirements of the National Environmental Policy Act of 1969 (NEPA), public involvement was a crucial factor throughout the development of this comprehensive conservation plan (CCP). This CCP has been written with input and assistance from interested citizens; tribal liaisons; conservation organizations; employees of local, state, and federal agencies; and other Service agencies. The participation of these stakeholders and their ideas has been of great value in setting the refuge's management direction. The Service as a whole, and the refuge staff, in particular, are grateful to each individual who has contributed time, expertise, and ideas to the planning process. The staff remains impressed by the passion and commitment of so many individuals for the lands and waters administered by the refuge.

The intergovernmental scoping was initiated December 1, 2012, with letters sent to other federal agencies, tribal agencies and governments, Mississippi congressional contacts, Governor of Mississippi, state legislators, and state agencies, inviting them to participate in the refuge's comprehensive planning process.

The Key Contacts List (found in the administrative record at the refuge) documents individuals who were contacted from governmental organizations, including Mississippi congressional, federal, tribal, state, and local state offices. Of these groups, the Mississippi Department of Wildlife, Fisheries, and Parks appointed Dave Godwin as a liaison to the Service for this effort. MSU appointed James Martin, assistant professor in the Department of Wildlife, Fisheries, and Aquaculture, and a member of the Agricultural and Carnivore Ecology Laboratories to assist and be a liaison to the Service. The tribes designated Ms. LaDonna Brown, Historic Preservation Officer from Chickasaw Nation, and Kenneth Carleton, Tribal Archaeologist and Tribal Historic Preservation Officer from Mississippi Band of Choctaws, as tribal liaisons. The Starkville School District designated Beverly Smith, Entomologist, and Larry Box, Education Center Director, as liaisons.

In preparation for the CCP, public scoping was conducted. A notice of intent, announcing the Service's intent to prepare a CCP for the refuge, was published in the *Federal Register* on January 15, 2013. An advertised public comment period for public scoping was held from January 15 – February 15, 2013. Notices informing the public of the CCP scoping process and inviting the public to attend a scheduled public scoping meeting were published in local newspapers. The news release was e-mailed to 325 newspaper, radio, TV, and on-line reporters and editors in Mississippi at 1 p.m. on January 14, 2013. Flyers announcing the same were also displayed at several locations at and around the refuge, including all kiosks, the visitor center, and check stations, and sent via e-mail to all public contacts on January 14, 2013.

The public scoping meetings were conducted on January 18, 2013, at the Noxubee Civic Center in Macon, Mississippi; on January 22, 2013, at Lake Tiak-O'Khata Resort in Louisville, Mississippi; and on January 24, 2013, at the Shriner's Club in Starkville, Mississippi. The meetings introduced the comprehensive planning process to the public and allowed attendees to voice their comments and perspectives on the issues, concerns, and opportunities they felt should be addressed in the CCP. The following organizations and cities were represented: City of Macon; City of Brooksville; Noxubee County; Mississippi Chapter of the National Wildlife Turkey Federation; MSU; Philip Good Realty; Extension Service; Bank First Financial Services; Friends of Noxubee Refuge, Inc.; Winston County Economic Development Partnership; The Audubon Society; WCBI-TV (a CBS affiliate); Task Force for the Scenic

---

Byway; Kemp Associates, LLC.; Mississippi Department of Wildlife Fisheries, and Parks; and the Department of Forestry, MSU, and the Service. The refuge received approximately 211 written comments. These comments are summarized in Appendix D. A mailing list of names and addresses was generated from the public scoping meetings, responses to the comment sheets, and letters received through the U.S. mail. These individuals will be included in all future mailings related to the development of the Final CCP.

To obtain expert opinions, the Service used results from several review teams that assessed the refuge's programs. One team conducted a review of the refuge's wildlife and habitat management programs in 2010. A second team reviewed the refuge's visitor services' program in 2011, and the third team conducted a wilderness review in 2013. In addition, an Intergovernmental Scoping Team met on January 17, 2013, to identify the issues and concerns to be addressed in the CCP. A list of experts from the Service and partnering agencies that participated in these multiple reviews and meetings is provided in Section B, Chapter V, Consultation and Coordination. The information garnered from these reviews helped the Service's planning team identify the key issues and concerns that needed to be addressed in this planning effort.

In 2013, a CCP planning team of Service staff, MDWFP, Starkville School District, and MSU representatives started meeting regularly to develop the CCP for the refuge. The team considered all public and interagency comments. The team prioritized the issues that needed to be addressed by the refuge over the 15-year life of the CCP based on the comments and recommendations of the advisory teams and the comments obtained through public scoping.

## **SUMMARY OF ISSUES, CONCERNS, AND OPPORTUNITIES**

Based on internal, public, and intergovernmental scoping, the Service identified a total of 16 priority resource issues related to fish and wildlife population management, habitat management, resource protection, visitor services, and refuge administration. All public and advisory team comments were considered; however, some issues that may be important to the public are beyond the scope of the Service's authority and cannot be addressed in this planning process. The Service did consider all issues that were raised throughout the planning process and has developed a plan that attempts to balance competing opinions regarding important issues. The Service identified those issues that, in its best professional judgment, are priorities for future refuge management. The priority issues are summarized below by major topic.

### **Fish and Wildlife Population Management**

- Decline in and threats to waterfowl
- Decline in and threats to forest breeding birds
- Threats to the red-cockaded woodpecker
- Lack of baseline data and monitoring for many wildlife and plant species
- Negative impacts from and presence and spread of invasive species

### **Habitat Management**

- Need for increased management of aquatic environments
- Decline in habitat quality of bottomland hardwood forests
- Need for old fields to be reverted into pine and pine hardwood habitats
- Need for active forest management
- Decline in habitat quality of upland forests

### **Resource Protection**

- 
- Threats to cultural resources
  - Threats to refuge habitats if land within the approved acquisition boundary is never acquired
  - Lack of funding and increased priorities on resources of concern to continue maintaining Research Natural Areas and Wilderness Study Area
  - Need for increased law enforcement and patrol activities

#### Visitor Services

- Need for increased support of fishing and hunting activities
- Demand for more or upgraded public use activities
- Lack of improved signage and access to information
- Need for effective environmental education programs to help minimize negative impacts to wildlife and habitat

#### Refuge Administration

- Lack of sufficient administrative resources to address increasing demands and increasing impacts
- Need for an additional fee within the Fee Program covering general access to the refuge

NOTE: Below we will briefly articulate the background and reasoning behind each of the concerns.

### *FISH AND WILDLIFE POPULATION MANAGEMENT*

- Decline in and threats to waterfowl
- Decline in and threats to forest breeding birds
- Threats to the red-cockaded woodpecker
- Lack of baseline data and monitoring for many wildlife and plant species
- Negative impacts from and presence/spread of invasive and exotic species

Migratory waterfowl was selected as a resource of concern because of the refuge's establishing purposes and conservation concern for their population densities. Although current conservation efforts have made great progress, historically, waterfowl suffered long-term declines due to loss of habitat, overharvest, and lead contamination of feeding areas. The refuge serves as an important migratory and wintering ground for thousands of migratory waterfowl, but waterfowl observations have declined over the past several years on the refuge. The reasons may be multifaceted and complex, but many experts believe that improved habitat conditions on private lands (e.g., providing more opportunity for better habitat elsewhere) and changes in migration patterns have contributed to decreased waterfowl observations on refuges.

Nearly 350 species of forest breeding birds breed in the United States and Canada and winter in Latin America. Over the last century, there has been a decline in forest nesting populations over much of the eastern United States. Explanations for this decline range from loss and fragmentation of habitat, destruction of tropical forests where many migratory birds overwinter, cowbird parasitism, and increased nest predation. The major issues pertain to how the refuge can help support forest breeding birds to try and curve that downward population slope.

RCWs have very specific requirements to support reproduction and foraging. It is the only endangered species that is a permanent resident of the refuge. Combinations of several methods may be employed to ensure the RCW's survival, including active forest management, artificial nest cavities, removal of flying squirrels from potentially active or active nests, herbicides, prescribed fire, and mechanical treatments of woody vegetation to maintain their open pine habitat requirements.

---

Managing loblolly pine for a minimum of 100 years of age requires the 0.5-mile radius or 502-acre partition should optimally possess 300 acres of the pine habitat type in order to be managed toward recovery standards [i.e., Good Quality Foraging Habitat (GQFH)]. As defined by the recovery plan, the entire amount of foraging habitat needs to be within the 502-acre partition with at least half of that habitat being within a 0.25-mile of the cluster's center. Table 13 of RCW recovery plan (<http://www.fws.gov/rcwrecovery/files/RecoveryPlan/finalrecoveryplan.pdf>) provides details on what is required as GQFH. When managing under a strategy of providing at least 100-year old loblolly pine stands (preferred), a minimum of 120 acres within a partition should consist of mature pine species to manage for GQFH, with 100 acres meeting the GQFH standards. The remaining 180 acres are used to provide sustainable GQFH through rotational growth of new forest to replace that loss due to old age and disease.

Wildlife populations need to be adequately inventoried and monitored to establish baseline data, determine population trends, identify management needs, set priorities, and evaluate the impacts of management actions. Past emphasis toward management actions without monitoring has resulted in the lack of baseline data for many species that now require attention. The Inventorying and Monitoring policy (701fw2) and future development of a refuge Inventorying and Monitoring Plan will also increase efficiency and scientific rigor of survey activities.

Exotic and pest plant and animal species cause habitat loss by disrupting natural communities on the refuge. They displace native species and alter ecosystem functions. Water hyacinth (*Eichhoria crassipes*), cogongrass, bicolor lespezeza (*Lespedeza bicolor*), and Chinese privet (*Ligustrum sinense*) are all vegetative species that are found here on the refuge. Cogon grass is an exotic pest plant that affects refuge uplands. Where Cogon grass occurs, it often forms thick monotypic stands that crowd out other desirable plants. Bicolor lespezeza and Chinese privet are two additional exotic pest plant species that are so widespread over the refuge that control efforts are difficult. American lotus is a native invasive species found in refuge lakes and sloughs. Lotus plants form dense mats which shade out other more desirable plant species if left unchecked. In addition, lotus can impede water flow and recreational use. Beavers are native to the refuge but are a nuisance. Their dam building activity can cause extensive flooding and kill large acreages of bottomland hardwood forests. In addition, their habit of burrowing can damage refuge levees and roads. Feral hogs are also nuisance and exotic species now documented on the refuge. They are a major threat to plant and animal communities and can cause serious damage to road sides and levees through rooting.

## HABITAT MANAGEMENT

- Need for increased management of aquatic environments
- Decline in habitat quality of bottomland hardwood forests
- Need for old fields to be reverted into pine and pine hardwood habitats
- Need for active forest management
- Decline in habitat quality of upland forests

Manipulating water levels to control nuisance and exotic species, maintaining a balanced fisheries resource, providing food and nesting resources for both waterfowl and wading birds, and maintaining the diversity of the lakes are all issues that pose concerns. Most of these concerns are associated with the management of the water levels within the lakes. The manipulations of water levels allow management to better provide waterbird food resources and production of those resources while striving for minimal oxygen depletion which causes fish mortality. Also, from a public use standpoint, boat access becomes increasingly difficult with decreasing water depth within the lakes.

---

The issue with the majority of the bottomland hardwood forests found on the refuge is lack of midstory and understory diversity and the regeneration of shade-intolerant tree species. Mast-producing species, such as shade-intolerant oaks, are being removed from the system as they are being out-competed by shade-tolerant iron wood and elm. In areas managed as GTRs, tree loss due to extended and repeated flooding, is also occurring. To regenerate shade-intolerant mast-producing species while a seed source and a consistent habitat for forest breeding birds still exists, the forest canopy must be carefully managed to allow for sunlight to reach the forest floor. Timber harvest in the bottomland hardwood stands can create ideal conditions for regeneration of shade-intolerant species, as well as cover, browse, and structure for wildlife. Without disturbance and removal of trees from the canopy, the shade-intolerant species will gradually be phased out of this system and only occasionally occur naturally at storm damaged blow-down sites. The current forest is converting to shade-tolerant tree species such as ironwoods, sugarberries, and elms. A forest made up of these shade-tolerant species will not provide the needed food source used by many wildlife species to survive migration or winter. Disturbance is the key to sustaining mast-producing shade-tolerant species within the bottomland hardwood systems. Disturbance also creates the characteristics exhibited in mature bottomland hardwood forests, such as dens, cavities, canopy gaps, species diversity, vegetative diversity, and natural senescence.

GTRs were developed by impounding existing stands of bottomland hardwoods with levee systems containing water control structures. These impoundments are designed to hold water on bottomland hardwoods only during the trees' dormant season, fall and winter, thus the name "greentree." Each of these impoundments is frequently naturally flooded during winter, but GTR management allows extended and predictable water levels in both fall and winter, with the intention to provide nuts, acorns, vegetation, and invertebrates for wintering waterfowl. Flooding these reservoirs to a depth of less than 18 inches provides essential feeding and resting habitat for wintering waterfowl. However, continued and extended flooding of GTRs contributes to tree root damage and tree mortality and promotes the survival of water-tolerant species. Reductions in forest health impact both waterfowl and forest breeding birds. This reduction in forest health and the lack of disturbance within bottomland hardwood forests are seen as primary problems preventing the regeneration of shade-intolerant species within GTRs.

Due to the previous agricultural history, old fields are interspersed throughout the refuge. While providing diversity, old fields can also be a cause of fragmentation and loss of needed pine acres by RCWs. Forest fragmentation can result in increased brood parasitism and nest predation for forest nesting birds. As a result, many forest nesting bird species have lower reproductive success in habitat forests fragmented by fields. Due to losses in management capability with reductions in refuge staff, many old fields on the refuge are starting to regenerate into light seeded forest species often dominated by sweet gum.

To create the sustainable desired conditions for the endangered RCW and many migratory birds, active forest management will be required upon the refuge. The recovery plan for the RCW estimates for each RCW group at least 300 acres of contiguous pine habitat are required within each partition to sustain certain parameters (U.S. Fish and Wildlife Service 2003). In general, pine stands with a basal area less than 80 square feet per acre are used for foraging. Foraging RCWs do not appear to completely avoid stands with dense woody understory, but high basal area of midstory hardwoods and pine limits their use. To create the habitat required by the recovery plan, active forest management is a must. Additionally, the majority of pine forests located on the refuge is composed of 70-year-old loblolly pine. After approximately 100 years of age, old loblolly forests begin losing increasing numbers of trees to natural mortality and continue to show signs of stand breakup as the age of the stand increases. Several factors contribute to this breakup such as: insects, lightning,

---

wind-throw, diseases, and other causes of natural mortality. Active forest management provides small-scale opportunities to regenerate trees within a stand which may have naturally occurred at the landscape scale only after wide spread loss of a forest due to fire and insect damage. On the refuge, very little acreage of younger aged pine (1 to 30 years old) is regenerating into the appropriate tree sizes needed for future RCW habitat. Prescribed fire used to maintain the open habitat needed by the RCW frequently kills loblolly pine seedlings along with the unwanted hardwoods that are growing within the forest. Regeneration of pine requires prescribed fire to be excluded from the area for up to 10 or more years.

The upland hardwood ecosystem historically was composed of upland red oak and white oak species, shortleaf pine, and loblolly pine on the ridges and slopes. The drains were composed of more hardwood species such as American sycamore, willow oak, and water oak. One concern is that the shortleaf and longleaf pine has dwindled in the past due to the prevalence of loblolly pine, which is easily regenerated and faster growing than the shortleaf pine in areas not frequently impacted by fire. The shortleaf pine is still represented in the mixed pine hardwood forest but is decreasing in the mixed species pine forests in this area. The topography in these areas limit management activities due to potential erosion issues, natural springs, and limited access. There are upland hardwood areas in which active forest management could promote conditions favorable to the RCWs, but these areas may create isolated partitions and provide little benefit to the main body of the population. However, these partitions could allow dispersal into surrounding lands. It is also likely the hardwood drains would disrupt the continuity of these created clusters, possibly limiting partition size to less than 300 acres of continuous pine.

#### *RESOURCE PROTECTION*

- Threats to cultural resources
- Threats to refuge habitats if land within the approved acquisition boundary is never acquired
- Lack of funding and increased priorities on resources of concern while also trying to maintain Research Natural Areas and Wilderness Study Area
- Need for increased law enforcement and patrol activities

While the refuge provides protection for a number of archaeological and historical resources, vandalism and removal of these cultural resources continues to be a threat. The Service has an obligation to past, present, and future generations to safeguard these sites from these threats and cannot do so without adequate funding for archaeological surveys and law enforcement staffing. Large tracts of public lands may provide unique opportunities for public use, and so the continual involvement of law enforcement personnel is necessary to protect the resources, as well as the public. However, staff limitations preclude intensive protection of these resources on refuge lands, and as with other refuge issues, priorities must be established, which compete for available funding and staffing.

---

While 48,219 acres are currently under Service ownership and management at the refuge for wildlife and habitat protection, the refuge's approved acquisition boundary is 61,715 acres. Thus, 13,496 acres of properties previously identified as important to meeting the purposes of the refuge remain as privately owned within the approved acquisition boundary. These privately owned acres will likely continue to exist until there are willing sellers and the Service has adequate funding for fee-title land acquisition. Although currently most of these privately owned acres are agricultural or undeveloped, these acres are possible locations for increased residential, commercial, and industrial development from surrounding communities. Development of these properties would not only remove them from habitat available for wildlife but could pose threats to existing refuge habitats (e.g., encroachment, water quality and quantity concerns, and spread of invasive species).

There are two research natural areas that, in accordance with SAF standards, have been identified but left under the same management as the surrounding forest. Since their establishment, there has been no attempt to develop management plans or formally map or delineate these areas from the surrounding forests. Additionally, because of the size of these areas (less than 40 acres), management within the surrounding forest overly impacts the conditions of the sites and the areas do not meet the criteria as Research Natural Areas (RNAs). The Service no longer recognizes RNAs and the policy, 611 FW 1; the RNA concept is now obsolete.

## VISITOR SERVICES

- Need for increased support of fishing and hunting activities
- Demand for more and upgraded public use activities
- Lack of improved signage and access to information
- Need for effective environmental education programs to help minimize negative impacts to wildlife and habitat

The refuge provides opportunities for public uses that are compatible with the purposes for which the refuge was established and can be supported based on funding and staffing levels. Hunting and fishing are two of the six priority public uses on national wildlife refuges. At this time, the refuge offers a wide variety of hunting and fishing opportunities, but limitations have been placed to ensure compatibility. Overall, the most common question from the public is the desire for more improved access to the refuge. However, these requests often conflict with the purposes of the refuge. Some requested uses that are generally determined to be inappropriate include riding all-terrain vehicles, camping, and entering closed areas (Appendix F). Providing safety and compatible public uses requires a balanced approach and a focus on refuge priorities.

The refuge and the Starkville School District are partnering to staff the refuge's environmental education center, which hosts school groups from throughout Mississippi. As one of six priority public uses, the Service strives to make environmental education an important program for the surrounding community and the general public.

Good quality available sources of refuge information are critical to the public's appreciation and use of refuge resources. Information dissemination provides a vehicle for the Service to communicate to the public the many recreational opportunities available on the refuge, as well as the value of the natural resources. Limited staffing and funding often inhibits providing needed information to the public and the refuge needs to continue to seek improved methods for providing information while reaching resource management goals and the refuge's establishing purposes.

---

## **REFUGE ADMINISTRATION**

- Lack of sufficient administrative resources to address increasing demands and increasing impacts
- Need for an additional fees to be included in the Fee Program

The refuge continues to face increasing costs of operation, higher demands for public use activities, and more impacts to refuge resources with decreasing staffing and funding. The refuge's volunteer program is becoming an increasingly important workforce for meeting refuge priorities. However, volunteers continue to require staff support and funding to remain productive.

Due to lack of funding and staffing, it was proposed that the Service should impose a Public Use Fee for all users of the refuge, as well as to maintain fees associated with waterfowl and deer hunting. The public use fee within the fee program would allow support to be provided by the estimated 112,000 nonconsumptive visits to the refuge each year. Funding from this source would be available for providing increased levels of information sharing and maintenance of public use facilities.

## **WILDERNESS REVIEW**

Refuge planning policy requires a wilderness review as part of the comprehensive conservation planning process. A wilderness review was conducted in July 2013, by the Wilderness Review Team. In summary, the Service proposes that no other lands should be considered for wilderness. The results of the wilderness review are included in Appendix H.

## **PUBLIC REVIEW AND COMMENT**

A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). Public comments on this draft document were accepted from August 28 to October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

A total of 37 individuals submitted comments on the Draft Comprehensive Conservation Plan and Environmental Assessment, either in writing or at public forums held on September 29-Oct.1, 2014. More than one individual represented some agencies or organizations.

The geographic origins of the individual respondents who submitted comments are Tennessee, Mississippi, Florida, California, and Washington D.C.

Appendix D includes the public comments and Service responses.

---

## *IV. Management Direction*

### **INTRODUCTION**

The Service manages fish and wildlife habitats considering the needs of all natural and cultural resources in decision-making. Refuge management is conducted in accordance with all applicable laws and follows established Service policy. A requirement of the National Wildlife Refuge System Improvement Act of 1997 (Improvement Act) is for the Service to maintain the ecological health, diversity, and integrity of refuges. Public uses are allowed if they are appropriate and compatible with wildlife and habitat conservation. The Improvement Act identifies six priority wildlife-dependent public uses. These uses are: hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation.

Described below is the proposed revised comprehensive conservation plan for managing the refuge over the next 15 years. This proposed management direction contains the goals, objectives, and strategies that will be used to achieve the refuge vision.

#### **Considered Alternatives**

Three alternatives for managing the refuge were considered:

##### **Alternative A: No Action (Current Management)**

This alternative is referred to as our “No Action” or “Current Management” alternative, as required by the National Environmental Policy Act (NEPA). Under this alternative, no major changes to our biological, public use, and administrative management practices would occur from their current levels.

##### **Alternative B: Focus on Waterfowl and Federally Listed Species**

This management scheme places priority on the federally listed species and waterfowl which are integral to the refuge’s purpose. This alternative emphasizes active habitat management actions that would benefit the endangered red-cockaded woodpecker and waterfowl. Visitor service programs and facilities in support of the six priority public uses (e.g., hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation) would be much reduced below those levels for Alternatives A and C. Non-wildlife-dependent public uses would be phased out.

##### **Alternative C: (Preferred Alternative): Focus on Wildlife, Habitat Diversity, and Experiencing Nature**

This alternative will manage refuge resources to optimize native wildlife populations and habitats under a balanced and integrated approach not only for federally listed species (RCW) and migratory birds, but also for other native species such as white-tailed deer, wild turkey, Northern bobwhite, paddlefish, and forest breeding birds. This alternative also provides opportunities for the six priority public uses (e.g., hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation) and other wildlife-dependent activities found appropriate and compatible with the purposes for which the refuge was established.

Implementing the preferred alternative will result in habitat management based on historic habitat conditions as guided by law (Improvement Act) and policy (601 FW 3) for the Refuge System. Management will be implemented for the conservation of a diverse bottomland hardwood habitat to benefit migratory birds and resident wildlife. Upland habitats will be maintained within their historic

---

habitat conditions including mimicking the natural fire regime and disturbances needed to benefit migratory birds, red-cockaded woodpeckers, and resident wildlife. A focused effort will be made to prevent, reduce, and eradicate invasive species threatening the biological integrity of the refuge. Monitoring and reconnaissance of a variety of wildlife species, ranging from reptiles and amphibians to butterflies to species of concern, will be used to assess and practice adaptive management. Cooperative projects will be prioritized based on ability to meet management objectives outlined in the CCP, or to meet refuge purpose and conducted with universities and other agencies and individuals to provide biological information to be used in management decision-making. When compatible, the wildlife-dependent recreational opportunities for hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation will be provided, and in some instances enhanced, while achieving the refuge purposes.

## **VISION**

*Sam D. Hamilton Noxubee National Wildlife Refuge is a key puzzle piece within an interconnecting landscape otherwise dominated by small cities, rural communities, and lands devoted to agriculture and commercial forestry. The refuge includes pine forests, bottomland and upland hardwood forests, cypress swamps, and wetlands surrounding the historic Noxubee River whose channel and floodwaters support migratory bird species and a host of native flora and fauna. The refuge promises to conserve and manage its natural diversity by restoring and protecting historic habitats and wildlife while working with partners, listening to the American public, and promoting awareness. In the future, habitat management and public use program objectives will no longer be viewed through a lens of simply the next 15 years, but as one step in a continuing restoration process covering the next 100 years. Management of the refuge's habitats will be designed to support resources of concern and species of complimentary need. Refuge management will recognize the position of the refuge within the surrounding landscape and target those unique ecological roles it can fulfill within that landscape. New programs will be developed to provide users with a better understanding and appreciation of natural and cultural resources.*

## **GOALS, OBJECTIVES, AND STRATEGIES**

The goals, objectives, and strategies presented are the Service's response to the issues, concerns, and needs expressed by the planning team, the refuge staff and partners, and the public. Chapter V identifies the projects associated with the various strategies.

Goals describe the desired future conditions of a refuge in succinct statements. Each one translates to one or more objectives that define these conditions in measurable terms. Objectives are incremental steps planned to be taken to achieve a goal. Objectives are derived from the goals and provide a foundation for determining strategies, monitoring refuge accomplishments, and evaluating success. The following chapter is written to contain five major goals for which there are varying numbers of individual objectives. To smoothly communicate the management intent of this CCP to the public and professional audience, the objectives when read along with their strategies were written to be: (1) Specific, (2) Measurable, (3) Achievable, (4) Results-oriented, and (5) Time-fixed. These properties constitute the acronym "SMART." The attached Habitat Management Plan fully describes how the objectives with strategies are to be implemented within each of the refuge's management units.

These goals and SMART objectives with strategies reflect the Service's commitment to achieve the mandates of the Improvement Act, the mission of the Refuge System, and the purposes and vision of refuge. This CCP represents the Service's planned actions within the next 15 years.

---

## FISH AND WILDLIFE POPULATION MANAGEMENT

### Goal A: Fish and Wildlife Populations

Manage and protect migratory and native wildlife populations on Sam D. Hamilton Noxubee NWR to contribute to the purposes for which the refuge was established as well as to fulfill the mission of the National Wildlife Refuge System (701 FW 1, USFWS 1992).

**Discussion:** The refuge supports a diversity of fish and wildlife species including the red-cockaded woodpecker and wood stork, both federally listed threatened and endangered species. The refuge supports at least 254 species of birds, 47 species of mammals, 34 species of reptiles, 23 species of amphibians, 25 species of fish, and ever-expanding numbers of species of invertebrates (Appendix I). In combination with active management, the inherent potential within refuge habitats (combination and juxtaposition of the pine, upland hardwood, bottomland hardwood, and aquatic habitats) ensures a variety of food and cover options for biodiversity.

#### Sub-Goal A.1 - Waterfowl

Manage and protect waterfowl populations in concert with the goals and objectives of North American Waterfowl Management Plan (NAWMP).

**Discussion:** The refuge's importance as a wintering habitat and an inviolate sanctuary has been recognized since its establishment in 1940 under the Migratory Bird Conservation Act, with additional recognition for its role with breeding wood ducks. During the period from 1950 to 1961, yearly waterfowl numbers ranged from 11,000 to more than 100,000 waterfowl each winter with the refuge attempting to provide food resources for up to 15 million duck energy days (DED), which equates to providing food resources for 136,000 waterfowl per day over a 110-day winter season. These high numbers of waterfowl were associated with increased management emphasis on providing agricultural crops within the Jones Creek Unit, shallow water in four GTRs within the bottomland hardwoods, and moist-soil plants within the refuge's two main lakes during a time in history when little waterfowl habitat existed within the surrounding landscape. Today, the refuge continues to manage similar numbers of acres yearly for waterfowl by providing 338 acres of moist-soil plants within the Jones Creek Unit, approximately 1,340 acres of shallow water within four GTRs, and moist-soil plants within shallow water areas of the lakes. Current waterfowl numbers on the refuge are consistently less than 10,000 birds; likely due to changes in waterfowl migration patterns and new habitat being made available throughout the landscape on both public and private lands. Reconnaissance as reported within annual narratives indicates waterfowl numbers are now consistently lower than the 100,000 historically recorded, but species diversity remains high. Approximately 18 species of waterfowl utilize the refuge and receive benefits from the refuge's moist-soil plants, as well as resting areas within the refuge's lakes and bottomland hardwoods. Resident wood ducks occur throughout the aquatic habitats of the refuge. Management that increases the number of suitable cavity trees, increased mast production, and improvement in brood habitat will improve conditions for wood ducks and other waterfowl (Waterfowl Management Handbook for the Lower Mississippi River Valley).

- Objective A.1.1: Provide at minimum, 1.1-million DEDs over a 110-day period yearly through the possible combination of managed moist-soil plants, planted agricultural crops, lakes, and or seasonally flooded GTRs.

- 
- Strategy A.1.1.1: Provide sanctuary through closure of Priscock fields and northern areas of Bluff Lake to public use.
  - Strategy A.1.1.2: Conduct mid-winter waterfowl survey(s) for occupancy and use of habitat
  - Objective A.1.2: Yearly, enhance breeding waterfowl nesting opportunities by providing a minimum of 50 nest boxes and protect and promote natural cavities throughout the 15,507 acres of bottomland hardwood habitat.
    - Strategy A.1.2.1: Complete seasonal nest box checks for productivity and use.
    - Strategy A.1.2.2: Continue to mark and identify known cavity trees.
  - Objective A.1.3: Enhance approximately 200 acres of aquatic shrub habitat for brooding wood ducks over the life of the CCP.
    - Strategy A.1.3.1: Initiate a GIS program to map aquatic shrub habitat.
    - Strategy A.1.3.2: Initiate wood duck brood survey.
  - Objective A.1.4: Participate in wood duck banding program on approximately 400 acres to meet the yearly assigned refuge quota by National Migratory Bird Program to identify brood survival of breeding waterfowl populations.
    - Strategy A.1.4.1: Baiting, capture, and banding of wood ducks through rocket nets and or swim-in traps.

### **Sub-Goal A.2 - Waterbirds**

Manage and protect waterbird populations in concert with the goals and objectives of the North American Waterbird Conservation Plan (USFWS 2007).

Discussion: Several species of colonial waterbirds utilize the habitats on the refuge. At the current time, there is a large egret and ibis rookery, ranging from 32,000 birds in the past to around 12,000 birds currently, within Bluff Lake and several heron rookeries located along the Oktoc Creek and Noxubee rivers. The rookery within Bluff Lake is a prominent feature at the refuge and receives frequent disturbance by anglers and wildlife observers directly under the nests. Disturbance has shown to have potential negative effects on breeding bird nesting success and the minimum recommended buffer is 50 meters (Carney and Sydeman 1999). The refuge's mudflats and shallow water habitats within water impoundments, lakes, wetlands, and backwater areas of the bottomland hardwood forests provide important foraging habitat for waterbirds throughout all seasons. Important food resources are provided by managing for healthy fisheries, as well as artificially created seasonal shallow pools. Management of cypress habitat (nest sites and thermal cover) can benefit waterbird populations.

- Objective A.2.1: Enhance breeding waterbird nesting opportunities across the refuge by providing nesting habitat.

- 
- Strategy A.2.1.1: Provide areas of limited or no human access in order to reduce disturbance to waterbirds during critical life cycle stages by using a closure area around active rookery sites.
  - Objective A.2.2: Enhance thermal cover and reduce predation of waterbirds across the refuge by providing roosting habitat.
    - Strategy A.2.2.1: Protect rookeries around Bluff Lake through closures of these areas to public use.
  - Objective A.2.3: Increase brood survival of breeding waterbird populations by enhancing refuge habitats.
    - Strategy A.2.3.1: Provide seasonal drawdowns of approximately 600 acres of Bluff Lake to ensure mudflats and shallow water habitats and increase foraging opportunities.

### **Sub-Goal A.3 - Forest Breeding Birds**

Manage and protect forest breeding bird populations in concert with the goals and objectives of the Partners in Flight North American Landbird Conservation Plan (Rich et al., 2004).

Discussion: The refuge consists of approximately 15,507 acres of bottomland hardwood habitat that is used by a diverse assemblage of both resident and migratory birds. The bottomland hardwood habitat is particularly essential to forest-dependent birds throughout their life cycle and provides habitat for breeding, post-breeding survivorship of adults and young, stopover habitat for migratory landbirds, and wintering habitat for many species. In particular, a suite of forest breeding and interior songbirds has been identified as a high priority and should be considered within the context of forest management activities occurring on the refuge (Note: for more details on songbirds reference Partners-in-Flight).

The issues affecting forest breeding birds on the refuge are forest fragmentation, habitat loss, and degradation of habitat. Long-term forest fragmentation within the refuge is primarily caused by refuge roads and levees, but old field management and development of public use facilities also play roles. Tree species diversity and forest structure are the other issues on the refuge because of the high percentage of forested habitats. For example, without perturbation, such as occurs through active silvicultural management (e.g., even- and uneven-aged management) or natural disturbances (e.g., tornadoes), maturing forests tend to develop closed over-story canopies that impede light penetration into lower layers of the forest. Limited light penetration results in sparse ground cover, understory, and midstory vegetation. Many forest birds are dependent on dense understory and ground vegetation for nesting, foraging, and escape cover. Thus, silvicultural harvests that increase light penetration, while maintaining a partial over-story canopy, are beneficial to many forest bird species. Even-aged and uneven-aged forest management techniques may be used to achieve a specific habitat need. Some forest breeding birds such as cerulean warblers (Hamel 2000) are dependent upon canopy gaps that provide complex vertical and horizontal structure for nesting and feeding. Studies in bottomland hardwood forests have shown that many species increase their use of forested habitat during the breeding period, but that many species may selectively choose canopy gaps and gap edges during the non-breeding period. These small gaps created within mature forests may increase species richness (Bowen et al. 2007). Young

---

birds often rely on small openings in the forest that provide patches of dense understory for use during post-fledging (Anders et al. 1998, Vega Rivera et al. 1998), and this understory provides foraging opportunities for transient migrants in spring and fall (Blake and Hoppes 1986).

Another species being threatened by habitat deforestation and conversion within the southeast is the prothonotary warbler (*Protonotaria citrea*). They are common migratory birds associated within bottomland hardwood and floodplain forests of the refuge. As a secondary cavity nester, prothonotary warblers will occupy abandoned woodpecker cavities or other natural cavities contained within dead snags or branches of living trees. Nests are customarily located over or within 5 meters of large bodies of stagnant or slow-moving water, creeks, and streams such as the Noxubee River and its tributaries or seasonally flooded bottomland hardwood forest and bald cypress swamps. GTRs within the refuge also provide excellent habitat for prothonotary warblers. After drawdown, small pools of water will provide excellent foraging habitat. The backwaters of Bluff Lake provide many forested acres that provide adequate habitat as well. Common nest-cavity trees are bald cypress, willows, and sweet gum. Canopy height may significantly vary between 12 and 40 meters and canopy cover approximates 50-75 percent. Ground vegetation is sparse and of low stature. The relatively open microhabitat also provides suitable foraging habitat for the acadian flycatcher (*Empidonax virescens*). Prone to nest parasitism by brown-headed cowbirds (*Molothrus ater*) and exhibiting area sensitivity to habitat fragmentation, prothonotary warblers flourish at the refuge where forests greatly exceed 100 hectares.

With limited expanses of bottomland hardwood forest found in this portion of the state, the refuge plays an important role within the landscape for the yellow-throated warbler (*Dendroica dominica*). Nesting near water and at the end of horizontal canopy limbs of mature bottomland hardwoods and cypress swamps, such as that contained within Bluff Lake, the nests are constructed of leaves, herbaceous vegetation, and pine needles. Selective of foraging substrate, the yellow-throated warbler is strongly preferential to bald cypress and tupelo while avoiding other tree species, especially red maple. The yellow-throated warbler is also known to occupy dry, upland oak-pine forest and will forage on pine cones of loblolly pine, an abundant coniferous species on the refuge.

Abundant within late-successional forest rather than mid- or early-successional forests, the Louisiana waterthrush (*Parkesia motacilla*) occupies a variety of habitats ranging from mature deciduous forest to bottomland hardwoods. Because anthropogenic land uses and acidification processes degrade streambeds, the Louisiana waterthrush is highly dependent on medium to high grade, first- to third-order streams such as the Noxubee River and Oktoc Creek and their associated tributaries to forage for benthic macroinvertebrate communities. Preferential to selecting stream orders of high water quality, the Louisiana waterthrush requires well-developed pools and riffles with rocky or sandy substrate. The refuge forest provides nesting cover, such as small cavities and hollows, within upturned and fallen trees. Exhibiting habitat sensitivity not only to stream order and water quality, but the Louisiana waterthrush requires forest area greater than 350 hectares with the following habitat specifications: > 80% of canopy cover, <25% shrub cover, a 30-69% ratio of deciduous to coniferous cover, and <25% herbaceous cover.

Within floodplains and forests such as those provided by the refuge, the wood thrush (*Hylocichla mustelina*) is preferential to mid- to late-successional timber classes within transitional shrublands, deciduous and mixed forests, and woody wetlands; wood thrushes avoid commercial evergreen plantations. These birds require forests comprised of moderate

---

densities of mid-canopy trees and shrubs for nesting, and open understories with ample leaf litter for foraging. Although these birds display some sensitivity to patch size, wood thrushes will nest in small forest fragments (<1 acre) and narrow riparian strips (<500 feet in width) but are often unsuccessful due to nest parasitism by brown-headed cowbirds and predation. Nest efficiency and productivity significantly increase for this species when habitat is greater than 200 acres and buffers are wider than 1,700 feet. Nest success also correlates with forest suitability, which in turn is influenced by size and landscape context. Selective silvicultural harvests may generate nesting and foraging sites if 70-80 percent of the forest remains intact (Evans et al. 2011).

Although extensive historical land conversion has eliminated vast expanses of forested wetlands and bottomland hardwood forests within the southeast, the refuge can provide extensive habitat for overwintering rusty blackbirds. Within forests, rusty blackbirds favor bottomland hardwood forests and bald cypress sloughs, but also occur in croplands and lawns. Rusty blackbirds primarily forage on ground stratum, to a lesser extent on floating mats or emergent vegetation and arboreal foraging. This species feeds on arthropods, insects, and berries in the leaf litter or puddles (Hamel 1992). Greenberg (2008) reported that on the wintering grounds, rusty blackbirds are ecological specialists. In bottomland hardwood forests and bald cypress sloughs, they seem to favor shallow, fluctuating surface water beneath or surrounded by forest canopy. The fluctuating water exposes mud flats where the rusty blackbirds forage for invertebrates. Aside from invertebrates, they also feed upon tiny acorn mast such as willow oak acorns and tree mast. This mast may provide sustenance when conditions are not right for foraging on insects and small fish in vernal pools (Greenberg 2008). Other studies have found that the rusty blackbirds are commonly found in a variety of forested wetlands and adjacent agricultural fields. They appear to depend on forest wetlands with open water, but may use nearby disturbed sites, possibly to supplement with principal winter diet of invertebrates, acorns, and pine seeds with waste grains and weed seeds (Greenberg et al. 2010). However, few studies of nonbreeding habitat are available for the rusty blackbird and these only reflect local conditions. No existing study satisfactorily explains how these birds use habitat at a landscape scale, or what the size of such a landscape might be. Until there is more detailed information on typical habitat elements within nonbreeding ranges, specification of what constitutes habitat is necessarily general (Hamel et al. 2009).

The Lower Mississippi Valley Joint Venture's Forest Resource Conservation Working Group developed a publication outlining "Desired Forest Conditions." This report, "Forest Restoration, Management, and Monitoring of Forest Resources in the Mississippi Alluvial Valley: Recommendations for Enhancing Wildlife Habitat" (LMVJV Forest Resources Conservation Working Group 2007), reviews the habitat needs of priority wildlife species and proposes "Desired Forest Conditions" at multiple spatial scales (landscape and stand-level) to enhance wildlife habitat. Additionally, the report presents several recommendations for improving reforestation and forest management activities. Implementation will provide habitat to benefit a wide array of priority wildlife species. Forest management activities occurring within Desired Forest Condition parameters would benefit priority Partners in Flight (PIF) forest birds and Species of Greatest Conservation Need (SGCN), as well as a suite of priority non-avian wildlife species dependent upon forests.

- Objective A.3.1: Enhance forest breeding bird populations through nesting, brooding, and foraging opportunities.
  - Strategy A.3.1.1: Provide birds with structurally diverse forested habitat.

- 
- Strategy A.3.1.2: Work to eradicate feral hogs.
  - Objective A.3.2: Enhance over-wintering forest breeding bird populations through foraging and thermal cover opportunities.
    - Strategy A.3.2.1: Provide birds with structurally diverse forested habitat.

#### **Sub-Goal A.4 - Threatened and Endangered Species**

Manage and protect threatened and endangered species in concert with the Endangered Species Act (730 FW 2).

Discussion: Two federally listed threatened and endangered species are known to use the refuge: the RCW and the wood stork. The wood stork migrates to the refuge during summer and uses the bottomland hardwood and associated shallow water sites for feeding and roosting, but does not currently breed on the refuge. The RCW is a year-round resident within the refuge's open pine habitats.

Wood storks visit the refuge during their non-breeding season to feed and rest within the refuge's bottomland hardwood habitats. The refuge's wood stork population has increased in size through time. More than 100 birds use the refuge seasonally, visiting shallow water areas for feeding and cypress forest for roosting. The storks benefit from the refuge's existing water management practice of drawing down water within Bluff Lake which provides isolated pools of fish on which the birds feed. These birds get additional benefits from the refuge's moist-soil management practices that create mudflats and shallow pools within which the birds feed. Existing closed areas provide sanctuary for these birds along with secluded areas throughout the wet bottomlands. Management that continues to support these needs will benefit these summer migratory birds.

The RCW recovery plan lists the refuge's RCW population as a "support population" (USFWS 2003). This term means that the population on the refuge is not necessary for down-listing or delisting of the species. Rather, the refuge's RCW population supports recovery by providing RCW immigrants and genetic resources to other recovery populations during a time when many designated recovery populations have not reached their population size objectives. Up until this present time, no birds from the refuge's population have been translocated to other populations. As of 2014, the refuge had 58 monitored RCW clusters; 28 clusters are actively occupied by RCW groups (active) and 30 are inactive (unoccupied). Of the 30 inactive clusters, 24 of these have been inactive for more than 5 years (abandoned) and may be no longer considered an RCW cluster. Habitat within these abandoned cluster partitions may be better used toward meeting habitat of adjacent active partitions, rehabilitated to form recruitment clusters, or simply managed similarly to that of the surrounding management unit.

It is important to establish an RCW target population goal for the refuge based on a special analysis that considers not only the cumulative total amount of pine dominated habitat but also the placement of this habitat that will be available to sustainably provide GQFH for red-cockaded woodpeckers. The previous CCP set the RCW population goal at 88 groups based on dividing the cumulative total for proposed target number of pine acres by 250 acres; at the time 205 acres of contiguous pine was the number of acres estimated needed to sustain a group of birds. The refuge went on to create 58 clusters in an attempt to reach that goal. Many of the artificially created clusters were placed in habitats that were in close proximity to other clusters or limited in acres of pine habitat. From the mid-1980s and early 1990s, the refuge population nearly doubled to 32 groups. By 2000, with additional efforts to create and

translocate birds into new clusters, the population totaled 48 groups. However, the artificial increase in the number of groups was short-lived and over the next decade the population declined steadily to its 2014 level of 28 groups, of which 27 are potential breeding groups.

None of the habitat within the partitions of groups currently active on the refuge provides conditions meeting GQFH (Table 5). Prescribed burning has been an important tool to achieve control of under- and mid-story hardwoods and promote herbaceous growth within the RCW's foraging habitat. Forest management and thinning helps maintain proper forest basal areas and canopy spacing. However, existing forest and amounts of pine habitat available within partitions and the ability to sustain the forest into the future is mainly based on the placement cluster centers. Partitions with large acres (300 acres or more) of pine habitat are more effectively manageable for both current and future (sustainable) GQFH than those with small acres (less than 200 acres). When a group is located in non-pine dominated habitat or within pine habitat but in close proximity to hardwood habitats, large proportions of the partition are unavailable to meet GQFH. Groups that are isolated (more than 3 miles in distance) from other RCW groups are less likely to be naturally recolonized by dispersing RCWs because of their geographic isolation; increasing the likelihood the partition will become inactive and abandoned.

**Table 5. Good quality foraging habitat criteria and managed stability standard (Red-cockaded Woodpecker Recovery Plan, USFWS 2003) and current forest conditions**

	<b>Good Quality Foraging Habitat (GQFH) Criteria</b>	<b>Current Forest Conditions</b>
<b>Pine Age</b>	18 or more stems per acre of pine that are at least 60 years of age and 14" dbh minimal pine BA of 20 square feet per acre	>80 sq ft/ac are at least 60 years in most RCW partitions
<b>Pine Basal Area (DBH 10-14 in)</b>	BA of Pines 10-14" DBH is 0 to 40 square feet per acre	>80 sq ft/ac
<b>Pine Basal Area (DBH &lt;10 in)</b>	BA of Pines less than 10" is 10 square feet per acre and less than 20 stems per acre.	<5 sq ft/ac
<b>Total Stand Basal Area</b>	BA of all Pines more than 10" DBH is at least 40 square feet per acre. Total stand BA for loblolly forest should be kept below 80 square feet per acre minimum canopy spacing of 25 feet	>100 sq ft/ac

	<b>Good Quality Foraging Habitat (GQFH) Criteria</b>	<b>Current Forest Conditions</b>
<b>Groundcover</b>	Groundcover of native bunchgrass or other native, fire-tolerant, fire-dependent forbs total 40% or more of ground cover and midstory plants and are dense enough to carry growing season fire at least once every 5 years	Limited ground cover due to high BA not allowing sunlight to the forest floor
<b>Hardwood Midstory</b>	No hardwood midstory exist or it is sparse and less than 7 feet in height	Moderate to dense hardwood midstory within partitions
<b>Hardwood Overstory</b>	Canopy hardwoods are absent or less than 30% of canopy	Dense hardwood overstory within partitions
<b>Foraging Habitat Distance from Cluster</b>	The entire habitat is within 0.5-mile of center of cluster, and 50% is within 0.25-mile of center of cluster	The entire habitat is within 0.5-mile of center of cluster, and 50% is within 0.25-mile of center of cluster
<b>Foraging Stand Distance from Cluster or another Foraging Stand</b>	Foraging habitat is not separated by more than 200 feet of non-foraging areas; non-foraging areas include (1) any predominately hardwood forest, (2) pines stands less than 30 years in age, (3) cleared land, (4) paved roads, (5) utility ROW, and (6) water	Within 200 feet
<b>Prescribed Burning Cycle</b>	Growing season fire at least once every 5 years	Dormant and growing season fire every 2-3 years

It is the goal of future habitat management to shift cluster centers toward 300 acre or higher stands of pine to improve likelihood of providing sustainable habitat conditions within partitions toward meeting GQFH within current and future partitions (Figure 13). During the next 15-years, for those partitions with sufficient amounts (120 acres or more) of pine habitat to allow for development of GQFH, it will be important to incorporate forest stand regeneration in to the partitions management. For those existing partitions severely lacking in pine habitat, it will be important when possible to manage

---

cluster center locations toward larger blocks of pine habitat. Finally, it is also going to be important to plan the establishment of recruitment sites within locations suitable for the long-term management of RCW groups. Using spatial analysis, it is estimated that the refuge can manage 49 total groups within the refuge.

U.S. Fish & Wildlife Service  
Sam D. Hamilton Noxubee National Wildlife Refuge  
Brooksville, Mississippi

Historic RCW Cluster Map

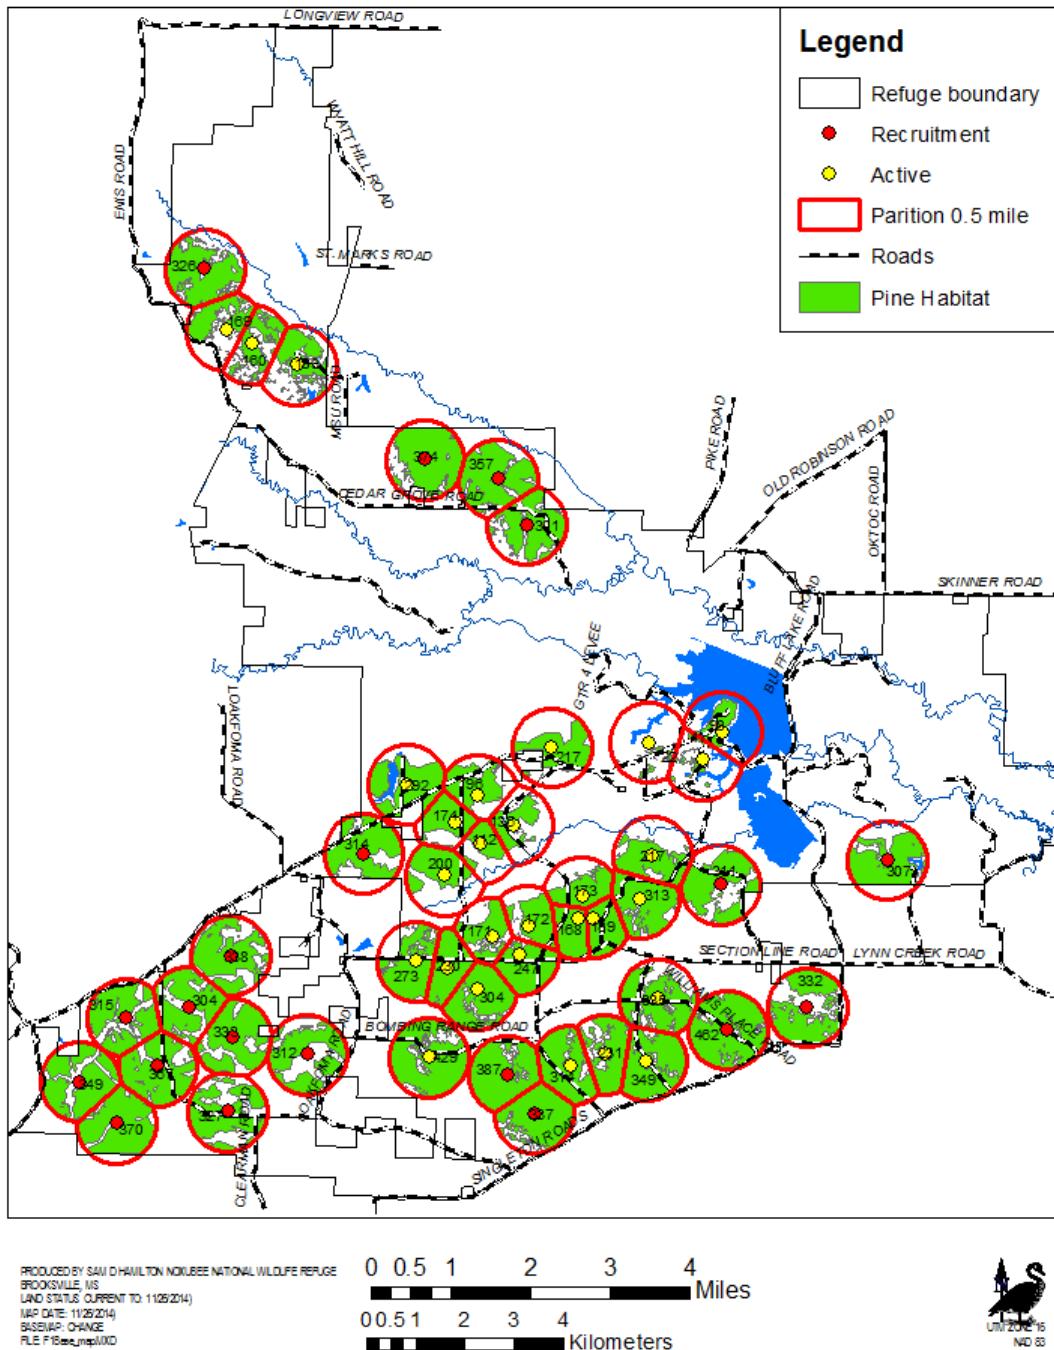

Figure 13. Spacial analysis showing RCW currently active and potential recruitment cluster centers and partitions after 50-year period

---

Objective A.4.1: Manage and protect RCWs as defined by the most current version of the Red-cockaded Woodpecker Recovery Plan (USFWS 2003).

- Strategy A.4.1.1: Monitor RCW cavities.
- Strategy A.4.1.3: Maintain at least four viable RCW cavities within each cluster.
- Strategy A.4.1.3: Work toward banding all adult and young RCWs.
- Objective A.4.2: Manipulate individual partitions by migrating cluster centers to optimize acres available to reach GQFH acreage requirements (Figure 13).
  - Strategy A.4.2.1: Complete analysis of forage habitat for all clusters
  - Strategy A.4.2.2: Complete analysis for forage habitat for pine habitats outside clusters that may be suitable for use by RCWs.
  - Strategy A.4.2.3: When needed, install new cavities in direction of pine habitat of greater suitability.
- Objective A.4.3: Manage and protect wood storks as defined by the Wood Stork Recovery Plan (USFWS 1997).
  - Strategy A.4.3.1: Protect wood storks from disturbance when roosting.
  - Strategy A.4.3.2: Limit speed of vehicles on roads and waterways in areas used by wood stork.
  - Strategy A.4.3.3: Maintain year-round closure of Priscock Fields.
  - Strategy A.4.3.4: Provide low water habitats as feeding areas.

#### **Sub-Goal A.5 - Eagles**

Manage and protect eagles in accordance with the Bald and Golden Eagle Protection Act (16 U.S.C. 668-668d).

Discussion: Up to seven bald and two golden eagles have been documented using the refuge. Bald eagles are present throughout the year and two nests are located within the refuge boundary, whereas golden eagles are currently present only during a few winter months. Golden eagles have only recently been documented and more information is needed. Protection of bald eagle nest sites from human disturbance currently exists based on the Bald and Golden Eagle Protection Act.

- Objective A.5.1: Continue to promote successful reproduction through site protection of existing eagle nests, survey for new eagle nests, and record reproductive success.
  - Strategy A.5.1.1: Establish and maintain closure areas around nest sites.
  - Strategy A.5.1.2: Promote monitoring using citizen scientists.
- Objective A.5.2: Coordinate all available information gathered by partners and cooperating agencies to assist in efforts to increase information base on eagles.

- 
- Strategy A.5.2.1: Maintain working relations with MDWFP staff.
  - Strategy A.5.2.1: Maintain working relations with MSU staff.

#### **Objective A.6: Resident and Other Species**

Manage and protect other species populations that have a direct tie to the purpose of the refuge and mission of the Service and to support the goals of Mississippi's Comprehensive Wildlife Conservation Strategy (MDWFP 2005).

Discussion: The refuge provides habitat for a variety of resident game and non-game species including white-tailed deer, Eastern wild turkey, Northern bobwhite quail, non-migratory Canada geese, American alligators, mammals (beaver, otter, muskrat, gray squirrel, fox squirrel, Eastern cottontail rabbit, bats), and a large variety of snakes, reptiles and amphibians. Historically, the refuge served a vital role in reestablishing many resident species that had been lost due to habitat loss in the late 1800s and early 1900s. Many of these resident species provide an important connection between the American public and wildlife, whether through hunting and fishing or wildlife observation. Species like white-tailed deer and beaver continue to require active population management, because their plentiful numbers make it possible for both species to negatively impact habitats. New insects and plants are discovered each year on the refuge, and it is important to ensure they are not unnecessarily disturbed as they may be rare within the refuge or the state.

- Objective A.6.1: Work with the State of Mississippi and other partners to incorporate, where possible, upland bird species management recommendations from national and state plans.
  - Strategy A.6.1.1: Seek input and active support from biologist with MDWFP.
  - Strategy A.6.1.2: Develop partnerships with non-governmental organizations that may support upland bird species management.
- Objective A.6.2: Target a harvest level to maintain a healthy deer population, with an appropriate sex and age structure at a level consistent with long-term habitat capability, to prevent degradation of habitats important to priority species, and to provide quality recreational opportunities.
  - Strategy A.6.2.1: Maintain a deer hunter quota system set based on target deer harvest numbers.
  - Strategy A.6.2.2: Require reporting of all game animals harvested.
- Objective A.6.3: Work with the State of Mississippi and other partners to incorporate, where possible, management recommendations on bats to support healthy, diverse, and viable populations.
  - Strategy A.6.3.1: Seek input and active support from biologist with MDWFP.
  - Strategy A.6.3.2: Develop partnerships with non-governmental organizations that may support bat species management.

- 
- Objective A.6.4: Work with the State of Mississippi and other partners to incorporate, where possible, management recommendations on reptile and amphibian species to support a healthy, diverse, and viable population.
    - Strategy A.6.4.1: Seek input and active support from biologist with MDWFP.
    - Strategy A.6.4.2: Develop partnerships with non-governmental organizations that may support amphibian species management.
  - Objective A.6.5: Work with the State of Mississippi and other partners to incorporate, where possible, management recommendations on invertebrates to support healthy, diverse, and viable populations.
    - Strategy A.6.5.1: Seek input and active support from biologist with MDWFP.
    - Strategy A.6.5.2: Develop partnerships with non-governmental organizations that may support invertebrate species management.
  - Objective A.6.6: Work with the Ecological Services, State of Mississippi, and other partners to locate, protect, and conserve, where possible, rare native plants.
    - Strategy A.6.6.1: Seek input and active support from biologist with MDWFP.
    - Strategy A.6.6.2: Develop partnerships with non-governmental organizations that may support rare native species management.

### **Sub-Goal A.7 - Aquatic Biota**

Manage and protect a diverse assemblage of native fish species, particularly those priority conservation actions identified for the Tombigbee Drainage within Mississippi's Comprehensive Wildlife Conservation Strategy (710 FW 1, USFWS 2006).

Discussion: Like migratory birds, the refuge's aquatic systems have a strong connection to the purposes for which the refuge was established. The National Wildlife Refuge System Administration Act states the refuge is for the "conservation, management, and restoration of the fish, wildlife, and plant resources and their habitats for the benefit of present and future generations of Americans." Following a history of reforestation, sediment loads, due to erosion of the highly erodible soils, have been slowed. Development of Mississippi's Best Management Practices has also promoted the protection of streamside management zones and water quality within lesser order streams. But, there appears to have been permanent changes within the refuge's hydrology. Old photographs reveal that since the establishment of the refuge, water quality entering and flowing within the Noxubee River and Oktoc Creek has changed from a clear stream with gravel shoals to a river of high silt loads and mud bottom. Bluff and Loakfoma lakes and Ross Branch Reservoir are artificial structures made within natural creek channels. These new bodies of water are now places where wildlife observation and angling can be enjoyed by the public. In addition, the refuge's four GTRs are additional artificial water bodies within the bottomland hardwood forest. Understanding the impacts of these changes is challenging. For example, the water control structures and levee associated with these water bodies can impede fish passage during spawning. Other impacts can be seen through forest diebacks when timber is flooded into the growing season.

---

Restoration and adjustments in management should continue to improve habitat for fish and other aquatic life when practiced under a balanced approach with other refuge resources.

- Objective A.7.1: Establish and maintain streamside management zones that meet or exceed criteria recommended by the State of Mississippi Best Management Practices to reduce non-point source pollution to improve water quality and stabilize water temperatures for native fish and mussel populations and to help mitigate changes in water temperature resulting from climate change.
  - Strategy A.7.1.1: Implement standards that protect at least 80 percent of diversity located in wetland areas.
  - Strategy A.7.1.2: Incorporate streamside management zone measures into the special conditions of relevant special use permits.
- Objective A.7.2: When not in conflict with waterfowl and threatened and endangered species management, maintain a balanced native fisheries population in lakes by managing size distribution, ratio of predator to prey, mortality rates, and other key parameters.
  - Strategy A.7.2.1: Monitor water levels using permanently fixed water level gauges.
  - Strategy A.7.2.2: Use geographic information systems to record and assess water level measures.
  - Strategy A.7.2.3: Periodically conduct fisheries monitoring.
  - Strategy A.7.2.4: Create deep-water habitats within Bluff Lake and use soil from excavations to create forested islands to serve as possible future rookeries for birds.
  - Strategy A.7.2.5: Use public use regulations as a tool in managing fish populations (i.e., slot or creel limits).
- Objective A.7.3: Support existing populations of paddlefish by manipulating water flow from the lakes during the key spring spawning migration periods of February 15 to May 1.
  - Strategy A.7.3.1: Weekly release at least an estimated 400 cubic feet per second of water for at least one, 8-hour period using the Bluff Lake radial arm water control structure to increase water flow in areas downstream of structure.
  - Strategy A.7.3.2: Maintain protection from the taking of paddlefish by anglers.
- Objective A.7.4: Maintain coarse woody debris to provide freshwater mussel and invertebrate populations with improved water quality in riverine habitats.

- 
- Strategy A.7.4.1: Prohibit the removal of natural debris from main channels Noxubee and Oktoc creeks.
  - Strategy A.7.4.2: Conduct mussel and invertebrate surveys.
  - Objective A.7.5: Restore fish connectivity between the Bluff Lake and Noxubee River by installing fish passage structures for paddlefish and potential Gulf Coast walleye populations.
    - Strategy A.7.5.1: Work with partners to better understand fish passage needs.
    - Strategy A.7.5.2: If the existing structure is replaced, consider designing fish passage features.

### **Sub-Goal A.8 - Exotic and Pest Species**

Minimize negative impacts of exotic and pest plant and animal species to levels that do not negatively affect other native species on the refuge (750 FW 1).

Discussion: Exotic species capable of spreading and invading into new areas are typically best labeled as generalists. These species normally adapt to new environments quickly and are highly prolific and superior competitors and predators. Some are very specialized and more efficient and effective than their native competitors at filling a particular niche. They compete for resources, alter community structure, displace native species, and may cause extirpations or extinctions. Invasive species often benefit from altered and declining natural ecosystems by filling niches of more specialized and displaced species with limited adaptability to changing environments. A basic tenant of the Improvement Act is management for biological diversity and integrity. The refuge has several documented exotic and pest animal species and free-roaming domestic and feral animals. These species impact the refuge's ability to carry out desired management objectives to varying degrees. For example, studies have shown that an adult feral hog will consume 160 pounds of hard mast, such as acorns, during a single winter (Yarrow and Kroll 1989) and also impact ground nesting birds, reptiles, amphibians, and other native wildlife located within the same habitat. Where the major habitat type is bottomland, feral hogs will be efficient competitors with native wildlife, including deer, Eastern wild turkey, Northern bobwhite, squirrels, and waterfowl for available hard mast resources. In addition to being a host of various diseases, such as swine brucellosis (*Brucella suis*), feral hogs cause enormous structural damage to levees and roadways by rooting large holes while feeding on grasses, roots, and stems. Exotic and feral animals, such as the feral hog, should be curtailed early and by any means possible, when such control is both practical and attainable. Whether plant or animal, exotic species will be spot treated as early as possible following detection, using integrated pest management. If beyond eradication, then efforts should be next directed to prevent further spread of the species within the refuge. Control of plant species, such as cogongrass, Japanese climbing fern (*Lygodium japonicum*), and bicolor lespedeza, are important as these plants quickly out-compete native plants.

- Objective A.8.1: Eradicate or control spread of exotic plant and animal species to promote native plant communities in terrestrial and aquatic systems.

- 
- Strategy A.8.1.1: Use geographic information systems to map known locations
  - Strategy A.8.1.2: Actively trap and remove exotic animals.
  - Strategy A.8.1.3: Actively remove or spray exotic plants with herbicides.
  - Objective A.8.2: Implement procedures to minimize spread of exotic species.
    - Strategy A.8.2.1: Restrict pass-through communter traffic to paved roads.
    - Strategy A.8.2.2: Improve equipment wash stations to reduce spread of exotic plant seeds.
    - Strategy A.8.2.3: When maintaining roads, reduce disturbance of soils and ground cover outside road system structure.
  - Objective A.8.3: Manage pest species under a balanced approach.
    - Strategy A.8.3.1: Only remove individual pest species when needed to control damage to habitat or protect refuge assets.
    - Strategy A.8.3.2: The refuge will practice zero tolerance for hogs and cogongrass for any alternative. Effort should be made to eradicate either wherever detected.

## HABITAT MANAGEMENT

### **Goal B: Habitats**

Manage and protect habitats for migratory and native wildlife on the refuge to contribute to the purposes for which the refuge was established, as well as to fulfill the mission of the National Wildlife Refuge System (620 FW 1, USFWS 2002).

Discussion: Wildlife habitat is the physical environment that provides the necessities of survival for a species. Wildlife is an integral part of any healthy environment. Within its habitat, a species can find food, water, shelter, and space that it needs to survive. In return, many of these species aid in seed dispersal, forest pest control, and many other ecological tasks that perpetuate healthy environments. Habitat management may involve manipulating the types, amount, or arrangement of food, water, and cover within a habitat for the purpose of making the habitat more suitable for a specific species or group.

#### **Sub-Goal B.1: Pine and Mixed Pine/Hardwood**

Achieve desired forest conditions within pine forests to protect, manage, enhance, and restore the values and functions of these habitats to sustain the biological needs of native wildlife and migratory birds.

---

**Discussion:** Natural and anthropogenic fires have always had a great influence on the refuge's pine communities by limiting the development of hardwoods. Prescribed fire is now fulfilling this role. Most of the historic pine forest within the refuge's boundary would have been shortleaf pine possibly mixed with longleaf and limited loblolly. However, today the refuge's pine forests are dominated by loblolly pine due to plantings accomplished 60 to 70 years ago during the early years after the refuge's establishment as an immediate effort to protect and restore the refuge's heavily eroded soils. Restoration of the refuge toward its historic forest conditions will likely need to continue for another 70 years. Management of historically pine habitats to meet the perpetual needs of the RCW will be a priority. Pine habitat currently occupied by active clusters will be managed toward providing GQFH. Silvicultural treatments designed to improve forest conditions and foraging habitat for RCWs within the pine stands will likely benefit other wildlife species as well. Managing for RCW into the future will not be easy. Managing RCW within the forest is fundamentally a spatial and temporal puzzle and as with puzzles, a good working surface is required and not all pieces fit the same.

Providing and sustaining GQFH for the RCW requires older trees, reaching the end of their life span, to be replaced with regenerating younger pine trees. GQFH is not sustained for many clusters due to limited acres for meeting both today's foraging needs and those needed 40 years from now (Table 6). Providing GQFH for active clusters is the management goal but without regeneration of the forest, habitat provided during the life span of the plan may be lost altogether in 40 years or more.

**Table 6. Distribution in pine age within existing partitions, Sam D. Hamilton NWR 2012**

Age-Class	Current Age Distribution
0 – 30	11.40%
31 - 60	11.10%
61 - 90	73.00%
91+	4.50%
<b>Total Acres:</b>	<b>100%</b>

In conjunction with an analysis of RCW foraging habitat, the forest community classification and historic forest conditions will be used to identify the types and locations suitable for RCW management. The location of future recruitment clusters will be designated in a spatially explicit manner, with each new partition assessed for the acreage and quality of existing and future potential RCW foraging habitat. The 2003 RCW recovery plan lists affirmative measures that also have been included in this CCP and HMP. These activities include:

- providing of artificial cavities where suitable cavities are naturally limited;
- controlling midstory and overstory hardwood encroachment in cluster and foraging habitat by active forest management, mechanical methods, herbicide, and prescribed fire;
- thinning timber in overstocked stands to avoid establishing dense and unsuitable RCW habitat;

- 
- prescribing frequent fire, particularly in the growing season, to control hardwood encroachment and stimulate development of a herbaceous plant ground layer;
  - reducing RCW cavity competition by other species and depredation by natural predators at cavities when essential;
  - restoring habitat and establishing recruitment clusters to increase population size;
  - monitoring cavities, clusters, reproduction, and population status to identify limiting factors

The following prohibitive measures listed within the 2003 RCW recovery plan are also to be adopted within the Final CCP and HMP:

- no use of roads through clusters for silvicultural operations;
- no removal of cavity trees, as supported by their designation, monumentation, and protection during timber or mechanical operations in clusters;
- no mechanical or cultural operations to improve habitat within clusters during the breeding season; and
- no clear-cutting of RCW habitat and, instead, regenerate pine stands by using a modification of even-aged silviculture to establish a two-age stand with retention of seed trees.
  - Objective B.1.1: Within Management Units 11 and 17, provide approximately 3,500 acres of beneficial Good Quality Foraging Habitat (Table 1) within all active and recruitment RCW clusters yearly, and optimally supplying predictable amounts of habitat to meet both current and long-term foraging and nesting requirements of the RCW.
    - Strategy B.1.1.1: Conduct RCW habitat monitoring according to the 2003 RCW recovery plan.
    - Strategy B.1.1.2: Conduct yearly forest monitoring, including measures of ground cover, or fire fuels monitoring with measures of ground cover and litter.
    - Strategy B.1.1.3: Conduct nest checks and banded bird observations according to the 2003 RCW recovery plan.
  - Objective B.1.2: Manage up to 8,500 acres of open pine forests in MU 11, MU 16 and 17 to provide sustainable GQFH outside identified RCW partitions to benefit RCW and other native wildlife species.
  - Objective B.1.3: All active RCW partitions would be managed to meet GQFH as long as RCW remain active within the area. For abandoned clusters, habitat will be managed for historical forest cover conditions to benefit priority species within that habitat.

---

### **Sub-Goal B.2 - Bottomland Hardwood Forests**

Achieve desired forest conditions within bottomland hardwood forest to protect, manage, enhance, and restore the values and functions of these habitats to sustain the biological needs of native wildlife by implementing recommendations within the LMVJV Restoration, Management, and Monitoring of Forest Resources in the Mississippi Alluvial Valley: Recommendations for Enhancing Wildlife Habitat 2007 (aka Desired Forest Conditions).

Discussion: Although the refuge is not specifically identified, the refuge contributes to the overall waterfowl goals of the North American Waterfowl Management Plan (USFWS 1986). Since its establishment, the refuge has provided both wintering habitat for migratory waterfowl and nesting habitat for wood ducks. In addition, the refuge's extensive bottomland hardwood forests provide habitat for a variety of neotropical migratory birds.

- Objective B.2.1: Manage approximately 18,000 acres of bottomland hardwood forests within Management Units 2, 5, 6, 8, 9, 13, 14, and 18, to maintain one-third to one-half in Desired Forest Conditions as recommended by Desired Forest Conditions Report of the LMVJV (2007) and encourage the growth of large cavity trees within and adjacent to water bodies.
  - Strategy B.2.1.1: Monitor the effects of forest management activities to maintain integrity of desired species composition, habitat structure, and forest health.
  - Strategy B.2.1.2: Complete forest inventories, including primary and secondary desired forest condition metrics (LMVJV 2007).
  - Strategy B.2.1.3: Monitor forest breeding bird species through landbird surveys (point counts).
- Objective B.2.2: Protect forest health (e.g., tree species diversity, tree vigor) within GTRs (~1,726 acres) from prolonged artificial flooding and maintain forest structural diversity to match that of the surrounding management unit of similar habitat type.

### **Sub-Goal B.3 - Aquatic Environments**

Actively manage approximately 252 acres of shallow water moist-soil impoundments, 1,200 acres of lakes, and 1,645 acres of GTRs for native species, including a diversity of reptiles, fish, and amphibians, and waterfowl species through water level manipulation and to fulfill the mission and purposes for which the refuge was established while maintaining functional integrity of the surrounding habitat.

Discussion: By managing these environments, needed food resources, such as moist-soil plant seeds, crops high in carbohydrates, and invertebrates, are provided to waterfowl to help replenish weight lost during migration. These foods are essential for providing the energy wintering ducks need to arrive on the breeding ground in good condition (Ringelman 1990). Additionally, these habitats can be managed to support wading birds including the wood stork, a proposed threatened species. The paddlefish is an inter-jurisdictional fish which occurs in the Noxubee River. Research is on-going to determine if paddlefish are spawning in Noxubee River and Oktoc Creek and what can be done to help paddlefish prosper. Inland ponds,

---

lakes, streams, wetlands with emergent vegetation, riparian and wooded wetlands, and beaver ponds also benefit fish, invertebrates, amphibians, reptiles, and crustaceans.

- Objective B.3.1: Provide at minimum 1.1-million DEDs over a 110-day period yearly through the possible combination of managed moist-soil plants, planted agricultural crops, lakes, and seasonally flooded GTRs.
- Objective B.3.2: Provide approximately 1,060 acres of shallow water lake habitat for seasonal use by wood stork and other wading birds, nesting and wintering waterfowl, and recreational anglers.
- Objective B.3.3: Operate Ross Branch Reservoir as a water supply to Management Unit 10, ensuring that the reservoir water volume reaches no less than 25 percent during winter months, with optimal depth being full pool during summer months.
- Objective B.3.4: Create deep water habitat within Bluff Lake to support native fish during periods of low water.

#### **Sub-Goal B.4 - Proposed Wilderness**

Manage the 1,200-acre proposed Wilderness to retain its primeval character and influence.

Discussion: A Wilderness Review was completed in 1974, resulting in a 1,200-acre proposed wilderness area within the National Wilderness Preservation System. The proposed wilderness area is managed using the guidance in the refuge manual (6 RM 8), Wilderness Area Management. Additional research natural areas were identified for protection and preservation but no action has been taken to clearly document their location nor plans developed for their management.

- Objective B.4.1: Provide approximately 1,200 acres of bottomland hardwood habitat benefiting forest breeding birds, within the context of protection of wilderness character attributes in accordance with the Wilderness Act (1964).
  - Strategy B.4.1.1: Monitor the effects of passive forest management activities to maintain integrity of desired species composition, habitat structure, and forest health.

### *RESOURCE PROTECTION*

#### **Goal C: Resource Protection**

Protect the natural and cultural resources of the refuge.

Discussion: The resource protection goal acknowledges that the refuge's natural (land, forests, water, wildlife, etc.) and cultural (old home sites, Native American artifacts, grave yards, etc.) resources face a variety of risks and threats over time. Refuge management must be vigilant to protect these resources from damage, theft, or degradation. The integrity of cultural resources may be impacted by vandalism, theft, or simple neglect. Land acquisition and recording of known sites is one method by which the Service attempts to protect natural and cultural resources. Education, interpretation, and enforcement of laws and regulations each play an additional role.

---

### **Sub-Goal C.1: Resource Management and Education**

Maintain, preserve, and protect archaeological, cultural, historical, and natural resources, representing the natural and cultural history of the local area.

Discussion: While on the refuge the public may encounter cultural resources with little to no associated interpretation. Cultural resources include historic properties as defined in the National Historic Preservation Act of 1966 (NHPA), cultural items as defined in the Native American Graves Protection and Repatriation Act (NAGPRA), archaeological resources as defined by Archaeological Resources Protection Act of 1979 (ARPA), sacred sites as defined in Executive Order 13007, *Protection and Accommodation of Access To "Indian Sacred Sites"* to which access is provided under the American Indian Religious Freedom Act (AIRFA), and collections. As defined by the NHPA, a historic property or historic resource is any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places (NRHP), including any artifacts, records, and remains that are related to and located in such properties. The term also includes properties of traditional religious and cultural importance (traditional cultural properties), which are eligible for inclusion in the NRHP as a result of their association with the cultural practices or beliefs of an American Indian tribe. Archaeological resources include any material of human life or activities that is at least 100 years old, and that is of archaeological interest. Archaeological and historical investigations on and near the refuge have been sporadic over the past century, though in recent years this trend has been changing. The refuge has several archaeological and historical sites that are documented and receive full protection. Many of these sites date back as far as to the Late Archaic period and are associated with Native American occupation. Current outreach regarding cultural resources includes information within refuge visitor center displays and information shared during special events.

It is important to the refuge to take steps so that staff, visitors and local community members do not lose connection with the land. Approximately 441 tracts have been acquired by the refuge. Today, each tract represents habitat for wildlife, but prior to acquisition it represents communities, families, and cultures. It will be a goal of the refuge to increase the amount of interpretation of the refuge's cultural resources while continuing to protect sites from unwanted disturbance. Displays may be added to the refuge's visitor center and information provided on refuge web sites and at kiosks throughout the refuge. The refuge may also consider development of displays within the individual tracts, informing visitors of previous landowners and land-use practices. The refuge will also encourage greater involvement of the arts in refuge activities, through such programs as an Artist-in-Residence Program. Maintaining an active connection with the past will be important to appreciating and understanding the path forward.

- Objective C.1.1: Over the life of the plan, implement outreach program that will provide information and preservation ethics on the refuge's cultural resources and history through interpretation and environmental education programs.
  - Strategy C.1.1.1: Incorporate information into visitor center displays, kiosk displays, and educational presentations.
  - Strategy C.1.1.2: With community involvement, establish historical plaques throughout the refuge to both inform and educate the public on cultural resources and history of the property.

- 
- Objective C.1.2: Conduct archaeological and historic investigations to inventory and evaluate historic properties pursuant to Section 110 of the NHPA and Section 14 of the ARPA.
    - Strategy C.1.2.1: Utilizing the refuge's realty files and other relevant archival materials, locate and document farms and other features, such as cemeteries, orchards, etc., present when the refuge was established and develop a "secure" historic property GIS data layer.
    - Strategy C.1.2.2: Work to develop shared archeological staff position with other local federal agencies.
    - Strategy C.1.2.3: Seek funding to conduct surveys.
  - Objective C.1.4: Consult with other federal agencies, State and Tribal Historic Preservation Offices, tribes, the professional historic preservation community, other cultural groups, and the general public when managing cultural resources.
    - Strategy C.1.4.1: Encourage active partnership with tribes and partners.
    - Strategy C.1.4.2: Encourage participation by partners in educational and outreach events.
    - Strategy C.1.4.3: The refuge, in consultation with the Choctaw Nation, the Jena Band of Choctaws, and the Mississippi Band of Choctaws, will attempt incorporate Native American perspectives into all facets of education, investigation, and refuge management.
  - Objective C.1.5: Facilitate partnerships with states, tribes, nonprofit organizations, academia, private landowners, and businesses for the development and implementation of a Cultural Resource Management Plan.
    - Strategy C.1.5.1: Develop Cultural Resources Management Plan
    - Strategy C.1.5.2: Integrate cultural resource preservation into refuge management plans and programs and evaluate the efficacy of these strategies.
    - Strategy C.1.5.3: Prior to any ground-disturbing activity continue to complete the "Request for Cultural Resource Compliance" form (Form RCRCR4) and forward it to the Regional Archaeologist for review.
    - Strategy C.1.5.4: Pertinent refuge staff will attempt to complete the Overview for Cultural Resources Management Requirements, FLETC's Archaeological Resources Training Program, Advanced Forensics Techniques and Crime Scene Investigation, and Archaeological Resources Protection Act training courses.

---

### **Sub-Goal C.2 - Protection**

Implement law enforcement procedures to protect the refuge's cultural resources and diminish site destruction due to looting and vandalism.

Discussion: The majority of refuge users visit the refuge to reconnect with nature and experience the outdoors. With the refuge having approximately 160,000 visits yearly, there is a need to impose rules and regulations to protect both the resources of the refuge and the visitors from harm.

- Objective C.2.1: The refuge will evaluate the efficacy of existing signage and other law enforcement tactics to prevent, enforce, and investigate illegal activity associated with cultural resources.
  - Strategy C.2.1.1: Maintain at least one full-time Federal Wildlife Officer as part of the refuge's permanent staff
  - Strategy C.2.1.2: Work to hire a second full-time Federal Wildlife Officer as part of the refuge's permanent staff
  - Strategy C.2.1.3: Maintain interior and exterior boundaries with appropriate signs indicating property ownership
  - Strategy C.2.1.4: Maintain and update regulatory signs on routine basis.

### **Sub-Goal C.3 - Land Acquisition**

Identify willing sellers and acquire private lands within the existing approved acquisition boundary that would enhance the conservation values of the refuge.

Discussion: Land acquisition and recording of known sites is one method by which the Service attempts to protect natural and cultural resources. The refuge currently has an approved acquisition boundary of 61,715 acres of which it currently manages 48,219 acres. The remaining 13,496 acres are under private or school board ownership.

- Objective C.3.1: Rank and attempt to acquire existing land within the approved acquisition boundary from willing sellers.
  - Strategy C.3.1.1: Contact potential willing sellers.
  - Strategy C.3.1.2: Use geographic information systems to manage and maintain realty property records.

### **Sub-Goal C.4 - Conservation Easements**

Continue to provide oversight on nine (9) Farm Service Agency Conservation Easements.

- Objective C.4.1: Contact current landowners of Farm Service Agency conservation easement to annually review both agreement and property for compliance.
  - Strategy C.4.1.1: Conduct yearly checks on Farm Service Agency properties.
  - Strategy C.4.1.2: Make yearly contact with property owners

- 
- Objective C.4.2: Mark boundary of easements.
    - Strategy C.4.2.1: Work with property owners to mark Farm Service Agency easement boundaries.

### **Sub-Goal C.5 - Wild-land Fire Urban Interface**

Provide resource protection to control wild fire.

- Objective C.5.1: Identify areas adjacent to and on the refuge that have an existing Wildfire Protection Plan (WFPP).
  - Strategy C.5.1.1: Use geographic information systems to identify and manage fire related information.
  - Strategy C.5.1.2: Meet with neighboring landowners to discuss fire related issues.
- Objective C.5.2: Develop and maintain mutual aid agreements with rural fire departments, State of Mississippi Forestry Commission, and USDA Forest Service to assist with wild fire suppression.
  - Strategy C.5.2.1: Meet annually with partners.

## **VISITOR SERVICES**

### **Goal D. Visitor Services**

Provide opportunities for compatible wildlife-dependent public uses that promote an understanding and appreciation of fish, wildlife, habitat conservation, and the mission of the National Wildlife Refuge System (605 FW 2, USFWS 2006).

Discussion: The Improvement Act recognizes six priority public uses (e.g., hunting, fishing, wildlife observation, wildlife photography, and environmental education, and interpretation) of the Refuge System. These uses, “where compatible with the refuge system mission and purposes of the individual refuges,” are considered “legitimate and appropriate public uses ... through which the American public can develop an appreciation for fish and wildlife” and shall receive “priority consideration in refuge planning and management.” The Improvement Act further states that “in administering the Refuge System, the Secretary shall ....provide increased opportunities for families to experience compatible wildlife-dependent recreation, particularly opportunities for parents and their children to safely engage in traditional outdoor activities, such as hunting and fishing....”

### **Sub-Goal D.1: Hunting**

Provide hunting opportunities while ensuring safe, compatible, and quality experiences.

Discussion: A long tradition of hunting exists at the refuge. Opportunities exist for hunters to experience waterfowl, white-tailed deer, turkey, and small game hunting. Currently, both non-consumptive and consumptive users are overlapping in their use of the over 42,000 acres of accessible refuge lands. For example, birdwatchers can walk into areas where handicapped hunters are hunting. The hunt plan has not been updated since the 1980s, and administrative adjustments need to be incorporated. Most changes will constitute updating language; however, consideration will be given to opening newly acquired properties to match refuge

---

hunting regulation in adjacent units. Establishment of “Connecting People with Nature” and “Experiencing Nature” areas could help reduce these conflicts. Within the “Experiencing Nature” area, hunting will be promoted and additional hunting opportunities facilitated when possible. For instance, areas other than GTR #1 could be opened to waterfowl hunting. Disabled hunter areas could be developed within another area of the refuge. Parking areas could be established for hunters. Other forms of hunter transportation (i.e., Off-road Vehicles) will not be considered because of their destruction of native plants.

- Objective D.1.1: Review and, if needed, update the Hunt Plan annually in conjunction with state agency and public input.
  - Strategy D.1.1.1: Participate in state coordination meetings.
  - Strategy D.1.1.2: Periodically host open house to increase public participation.
- Objective D.1.2: Promote hunting in areas other than the area defined as the “Connecting People with Nature” area.
  - Strategy D.1.2.1: Maintain, and if needed increase, information kiosks and check stations available to hunters.
  - Strategy D.1.2.2: Develop a disabled (as defined by Mississippi Admin Code Title 40 Part 2 Chapter 2 Rule 1.4 Special Use Regulations for Individuals with Disabilities) hunter program which provides for a natural hunting experience and increased access.
- Objective D.1.3: Ensure that water management associated with waterfowl hunting is compatible with the forest structure and forest species composition while providing public hunting opportunities.
  - Strategy D.1.3.1: Move waterfowl hunting areas so no one GTR is flooded more frequently than twice within a five-year period.
  - Strategy D.1.3.2: Allow up to two years of consecutive hunting within any one GTR.
- Objective D.1.4: Continue to ban use of all-terrain vehicles (ATVs), utility terrain vehicles (UTVs) and other off-road vehicles.
  - Strategy D.1.4.1: Use the refuge’s special use permit system to address individual users needing special consideration.
  - Strategy D.1.4.2: Restrict use of ATVs and UTVs to administrative uses only.
  - Strategy D.1.4.3: Improve administrative UTV trails to prevent erosion and protect water quality.
- Objective D.1.5: Continue to ban use of horses and other forms of equestrian uses.

- 
- Strategy D.1.5.1: Maintain road system to allow ample access by way of vehicle.
  - Strategy D.1.5.2: When not inside the proposed wilderness area, allow hunters and anglers to use bicycles and push-pull carts.
  - Objective D.1.6: Continue to protect the American alligator from harvest within the refuge boundary.
    - Strategy D.1.6.1: Continue to ban the hunting of alligators on the refuge.
    - Strategy D.1.6.2: Work with state biologists to manage individual alligators that become a threat to humans.
  - Objective D.1.7: Establish parking areas along Bluff Lake Road to allow better hunting access.
    - Strategy D.1.7.1: Attempt to provide at least one parking area for every half-mile of road distance.
    - Strategy D.1.7.2: Identify and map areas currently favored by refuge users and consider development of nearby parking areas.
  - Objective D.1.8: Partner with State of Mississippi and non-governmental organizations to host hunting opportunities for youth and disabled hunters.
    - Strategy D.1.8.1: Provide turkey hunt season open to qualifying disabled hunters.
    - Strategy D.1.8.2: Provide deer hunt season open to qualifying disabled hunters.
    - Strategy D.1.8.2: Continue to host youth squirrel hunting class in partnership with state and non-governmental organizations.

### **Sub-Goal D.2 - Fishing**

Provide fishing opportunities while ensuring safe, compatible, and quality experiences (605 FW 3, USFWS 2006).

Discussion: A long tradition of fishing exists at the refuge. Opportunities exist for anglers to fish in refuge lakes during a limited timeframe. Fishing will be promoted and additional opportunities and accommodations will be facilitated when possible.

- Objective D.2.1: Open year-round bank fishing on Bluff Lake where and when compatible with other priority uses.
  - Strategy D.2.1.1: Open to year-round bank fishing within Bluff Lake along eastern levee and southern shore.

- 
- Strategy D.2.1.2: Open plung pool below Bluff Lake radial arm structure to year-round fishing.
  - Objective D.2.2: Continue to support and expand handicapped fishing opportunities according to American Disabilities Act (ADA) guidelines.
    - Strategy D.2.2.1: Replace fishing pier at Ross Branch Reservoir with handicapped-accessible floating pier.
    - Strategy D.2.2.2: Replace fishing dock at Loakfoma Lake with handicapped-accessible floating pier.
    - Strategy D.2.2.3: Continue to develop handicapped fishing jetty within Loakfoma Lake for use by wheelchair-bound anglers.
    - Strategy D.2.2.4: Ensure piers and jetty meet ADA guidelines.
  - Objective D.2.3: Designate a non-motorized Bluff Lake boat launch near Cypress Cove.
    - Strategy D.2.3.1: Limit motorized boats within Bluff Lake to be launched from the improved concrete boat ramp on the southeast shore of the lake.
    - Strategy D.2.3.2: Consider development of concession for non-motorized boat rentals near Cypress Cove.
  - Objective D.2.4: Establish improved parking areas for spillways at Loakfoma and Bluff lakes, and Ross Branch Reservoir.
    - Strategy D.2.4.1: Provide paved drive and parking at Loakfoma Lake.
    - Strategy D.2.4.2: Provide paved parking at Bluff Lake motorized ramp and spillway lots.
    - Strategy D.2.4.3: Improve graveled parking at Ross Branch Reservoir.

### **Sub-Goal D.3 - Wildlife Observation and Photography**

Provide wildlife observation and photography opportunities while ensuring safe, compatible, and quality experiences.

Discussion: An estimated 160,000 visits occur on the refuge annually. Visitors can enjoy more than 42,000 acres of accessible refuge lands. Currently, both non-consumptive and consumptive user groups can utilize all open areas of the refuge. For example, hikers can walk into areas where hunters are hunting. As the non-consumptive user group grows, the refuge recognizes many of these visitors are not prepared for the wildness of some areas of the refuge. In order to orientate these visitors, the refuge will establish an area with additional services aimed at a more relaxed and enjoyable experience, while still encouraging and supporting “wildlife first” ideals.

- 
- Objective D.3.1: Establish a defined area around Bluff and Loakfoma lakes to serve as a “Connecting People with Nature” area for public users requiring greater support and developed amenities.
    - Strategy D.3.1.1: Replace existing public restrooms with self-contained, prefabricated restroom facility eliminating water and power use.
    - Strategy D.3.1.2: Transition existing picnic area to serve as “Connecting People with Nature” or wildlife viewing areas for families and users less able to experience the entire refuge.
    - Strategy D.3.1.3: Manage refuge trails to include only those within the “Connecting People to Nature” area and the Scattertown Trail.
    - Strategy D.3.1.4: If found compatible, limit non-wildlife-dependent activities to only the “Connecting People with Nature” areas.
    - Strategy D.3.1.5: Establish seasonal closure of trail segments within the RCW Clusters during periods of RCW nesting when in conflict with trail system.
    - Strategy D.3.1.6: Establish a developed (i.e., paved) wildlife observation trail for both bicycles and pedestrians extending from the motorized boat launch at Bluff Lake, and past the office and visitor center along the shore of Bluff Lake ending at the Goose Overlook. A loop extension would then proceed to the Smith Fields, down Goose Pen Road to Ewing Road, then around the southern end of Loakfoma Lake. The trail would then loop back to its origin along the paved Loakfoma Road.
    - Strategy D.3.1.7: Consider use of concessions to provide non-motorized canoe and kayak rentals for use within the “Connecting People with Nature” area.
    - Strategy D.3.1.8: Consider use of commercial activities including commercial filming, weddings, photography, and wildlife observation tours.
    - Strategy D.3.1.9: Prohibit hunting within the “Connecting People with Nature Area” unless connected to a specific education program.
  - Objective D.3.2: Establish a defined area outside Bluff and Loakfoma lakes to serve as the “Experiencing Nature” area for public users requiring little to no support and no developed amenities.
    - Strategy D.3.2.1: Limit recreational bicycling to roads open to motorized vehicles and trails specifically designated for bicycle use.

- 
- Strategy D.3.2.2: Discontinue maintenance of the Wilderness Trail and Craig Pond Trail.
  - Strategy D.3.2.3: Encourage exploration through cultural and historical plaque system.

#### **Sub-Goal D.4 - Interpretation**

Ensure the refuge is welcoming and visitors are provided with clear information that promotes and raises public awareness of the refuge and the Service.

Discussion: Many current visitors using the refuge's picnic area, boardwalks, trails, and observation towers are unaware of the fact they are visiting a national wildlife refuge. This is a crisis of identity for the refuge. As visitation grows, the refuge must find a way to connect the mission of the Service to the areas used by visitors.

- Objective D.4.1: Maintain refuge signs at or above current standards as stated in refuge sign manual.
  - Strategy D.4.1.1: Encourage greater volunteer involvement in maintainace of refuge assets.
- Objective D.4.2: Establish interpretive signage throughout the "Connecting People with Nature" area.
  - Strategy D.4.2.1: Identify key use and gathering locations for the visiting public.
  - Strategy D.4.2.2: Develop information kiosks best suited for informing and educating based on the use occurring within the location.

#### **Sub-Goal D.5 - Environmental Education**

Promote and utilize the Larry Box Environmental Education Center (EE Center) and other refuge resources to expand and enhance environmental education opportunities.

Discussion: The EE Center is a partnership between the refuge and the Starkville School District. It serves as a great way to connect children and young adults to nature. Only phase one of three phases of the project has been completed. When fully completed, the EE Center will be a self-sustaining facility to provide food, lodging, and support staff. Currently, only Starkville School District classes are able to use the EE Center at no cost. Other school districts must pay \$5 per student for use of the facility. Although the EE Center is owned by the Federal Government, it is maintained by the Starkville School District. The minimal fee is used to help purchase supplies furnished by the Starkville School District when students come to visit. If a school has never been to the EE Center, then the \$5 fee/student is waived, hopefully increasing interest.

- Objective D.5.1: Through a continued partnership and coordination with Starkville School District, MSU, and other educational groups, the refuge will continue to facilitate environmental education programs at the EE Center along with coordinated use of the refuge's visitor center and other refuge facilities.

- 
- Strategy D.5.1.1: Support wildlife-based educational activities and curriculum through the EE Center while following state and national core curriculums for elementary, middle, high school, and college students.
  - Strategy D.5.1.2: Develop better signage to keep the general public from interfering with classes.
  - Strategy D.5.1.3: Seek alternative funding and support opportunities for the EE Center to support higher levels of participation by both schools inside and outside the Starkville School District.
  - Objective D.5.2: Review and update the agreement with Starkville School District.
    - Strategy D.5.2.1: Promote the usage of the EE Center for environmental education and educationally based meetings.
    - Strategy D.5.2.2: Ensure there is no unauthorized access to the EE Center and Douglas Bluff environmental education zones.
    - Strategy D.5.2.3: Encourage greater active involvement of other area school systems.

#### **Sub-Goal D.6 - Public Access**

Manage public access to provide a safe human experience in an environmentally appropriate manner to support wildlife-dependent priority public uses while ensuring uses are compatible with the refuge purposes.

Discussion: It is the refuge's goal to provide quality public services. Budget funding allocations and staffing are insufficient to increase amenities or in some cases maintain current amenities. Alternative funding and changes to management must be considered to maintain current levels of visitor safety, opportunities, access, services, and facilities. For example, while maintaining access for visitors throughout the refuge, entry into the refuge may be restricted to Bluff Lake Road and Dummy Line Road. Visitors will be able to access areas of the southern portion of the refuge through interior roads from Dummy Line Road.

- Objective D.6.1: Maintain at least seven kiosks in all areas where public users gather.
  - Strategy D.6.1.1: Maintain sufficient kiosks at major refuge access points for public use.
  - Strategy D.6.1.2: Develop online virtual kiosks for visitors.
- Objective D.6.2: Allow public to only use those roads needed to support public use programs while ensuring public safety.
  - Strategy D.6.2.1: Establish limited number of key entry roads into the refuge at the following locations: refuge boundary at Bluff Lake Road near Logan Road, refuge boundary at Bluff Lake Road near Ross Branch Reservoir, the

---

intersection of Brooksville-Louisville (Singleton) and Dummy Line Roads, and Loakfoma Road at the Morgan Hill Refuge Boundary.

- Strategy D.6.2.2: Establish speed control measures to ensure public and wildlife safety in “Connecting People with Nature” area.
- Objective D.6.3: Maintain visible refuge boundary markers and signs.
  - Strategy D.6.3.1: Routinely check and replace boundary paint and signs.
  - Strategy D.6.3.2: Use geographic information systems and GPS to map and manage realty features.
- Objective D.6.4: Continue to update and enforce refuge regulations according to the Code of Federal Regulations (CFR).
  - Strategy D.6.4.1: Update refuge public use information, reflecting yearly changes.
  - Strategy D.6.4.2: Review and update the CFR to properly inform refuge users and protect refuge resources.
- Objective D.6.5: Establish a public use fee providing exemptions to private inholding landowners and partners (cooperating organizations). (Footnote: The Service will not collect fees from any person under 16 years of age; any person engaged in a non-recreational activity authorized under a valid permit issued by the refuge, such as landowners using private inholdings, commercial agriculture, etc., Service-authorized research activities; or federal, state, and tribal business or outings conducted for non-commercial educational purposes by schools or academic institutions).
  - Strategy D.6.5.1: Establish a public use fee for all users.
  - Strategy D.6.5.2: Maintain quota hunt fees for deer and waterfowl.
  - Strategy D.6.5.3: Maintain a special event permit fee.

#### **Sub-Goal D.7 - Outreach**

Provide outreach opportunities that promote an understanding and appreciation of fish, wildlife, habitat conservation, and the mission of the Refuge System.

Discussion: The use of social media has gained popularity in recent years. It is our goal to offer more quality information to this new age of technology-savvy visitors. Using this new technology to promote our “Wildlife First” mission will increase awareness to many new user groups.

- Objective D.7.1: By 2015, redesign refuge web page for ease of access and use.
  - Strategy D.7.1.1: Follow Department of the Interior and Service standards in development of web page.

- 
- Strategy D.7.1.2: Incorporate video and other features to encourage use by the general public.
  - Objective D.7.2: Participate in community development activities such as the Chamber of Commerce and Rotary Club.
    - Strategy D.7.2.1: Reestablish chamber of commerce memberships in all three counties within refuge boundary.
    - Strategy D.7.2.2: Provide public talks and presentations.
  - Objective D.7.3: By 2016, update and distribute information including general, trail, hunting, fishing, and public use information.
    - Strategy D.7.3.1: Conduct yearly review of information.
    - Strategy D.7.3.2: Move toward providing greater amounts of information electronically instead of the traditional paper products.
    - Strategy D.7.3.3: Use social media to reach out to and inform the public of refuge happenings.

#### **Sub-Goal D.8 - Open Lands**

Manage abandoned agricultural open field areas to the community type most suitable for meeting the refuge goals and objectives.

Discussion: Management for the endangered red-cockaded woodpecker takes priority over all other species within areas where historic forest conditions correspond to pine-dominated stands. Old fields on the refuge will be prioritized and converted to forest for future RCW habitat, if the field falls within current RCW foraging areas or proposed RCW recruitment areas. Fields located within areas designated for RCW management may be reforested to shortleaf, longleaf, and/or loblolly pine through replanting or natural regeneration. The preparation could consist of mechanical or chemical treatments and prescribed fire, to prepare the seedbed for optimal planting conditions. This will provide future habitat for RCWs, reduce fragmentation, and create diversity. Once these fields are converted to pine forests, they will be managed according to RCW recovery plan standards (GQFH) when applicable.

Areas outside of those designated will be maintained in grasslands to benefit pollinators and other native wildlife. Prairies, old fields, and roadsides provide essential habitat for pollinators, which help pollinate over 75 percent of our flowering plants, and nearly 75 percent of our crops. Many pollinators, like honey bees, have shown declines in recent years. Declines in pollinators may cause plants to go extinct, reduce food sources for both wildlife and humans, and decrease biodiversity. The main threats facing pollinators are habitat loss, degradation, and fragmentation (Mississippi Museum of Natural Science 2005).

- Objective D.8.1: Manage existing open fields for forested habitat when that is the best use of the land.
  - Strategy D.8.1.1: Replant or allow natural succession of trees into fields needed for the management of forest breeding birds or RCW.

- 
- Objective D.8.2: Manage existing open fields as fields when not needed for management of forest breeding birds or RCW.
    - Strategy D.8.2:1: Manage existing open fields within the Keaton Tower area for grassland songbirds and other native wildlife.
    - Strategy D.8.2.2: Manage up to 30 acres at Goose Overlook Field of non-native grasses for winter wildlife foraging as part of Public Use Program.
    - Strategy D.8.2.3: Maintain 31 acres of the Prairie Demonstration Area (Morgan Hill) as a Blackbelt Prairie Demonstration Area and regenerate the remaining acres into a mixed pine habitat to supplement RCW habitat in that area.

## **REFUGE ADMINISTRATION**

### **Goal E. Refuge Administration**

Provide sufficient leadership, staffing, information, and infrastructure to manage and protect migratory and native wildlife populations and their habitats, cultural resources, and compatible public uses that contribute to the purposes for which the refuge was established, as well as the mission of the National Wildlife Refuge System.

**Discussion:** Implementation of this CCP will depend on sufficient resources to follow through on objectives and strategies to accomplish the five goals. Resources include staff, equipment, facilities, and funds. Staff may come in the form of a paid professional staff or volunteers. Partnerships may be used to meet needs for staffing and funding. The refuge has an existing partnership with the Friends of Noxubee Refuge (Friends Group), a 501c3 non-profit organization that is designed to help the refuge through advocacy, fundraising, and volunteer work. Friend members support refuge activities and events, increase awareness of the refuge, educate the public about the Service's mission and increase fundraising. The Friends Group promotes and enhances the integrity of the refuge through activities that advance public understanding, awareness, appreciation, and enjoyment of the natural environment. The refuge currently possesses a wide range of equipment necessary to support refuge activities, including passenger vehicles, agricultural equipment, and heavy equipment. Building facilities include a maintenance shop, equipment repair shop, four housing units, three resident volunteer recreational vehicle pads, three vehicle storage sheds, a fire cache, a volunteer coordination center, a satellite office building, a Visitor Center and a public restroom facility.

#### **Sub-Goal E.1 - Operations and Maintenance**

Maintain quality programs, facilities, and infrastructure along with a highly skilled and trained professional staff.

**Discussion:** Each man-made feature on the refuge that requires operation and maintenance is considered an asset within the Service Asset and Maintenance Management System (SAMMS). At the current time the refuge has 308 assets listed within this system, with a total replacement cost of approximately \$140 million. Annual maintenance costs are estimated at approximately \$485,000. In Fiscal Year 2013, the refuge received \$166,670 (34%) in maintenance funding. At the time of the 2004 CCP, the refuge staff consisted of 17 individuals and proposed at that time to increase the staff by an additional 14 members. In Fiscal Year 2013, the refuge received funding for 11 positions (65%), showing a net loss of 6 positions since the completion of the 2004 CCP. At the current time, there are no immediate expectations of budget increases and instead the refuge may see a budget decrease, with a

---

need for further reduction of staff. Within the life span of this document, however, some level of increase is possible and therefore some optimism is designed into the objectives and strategies. Regardless, priorities will need to be scaled to match the staffing levels, financial conditions, and level of support obtained through use of volunteers and partnerships. Administrative actions tied to the refuge's purposes will be kept in the position of highest priority followed by wildlife-dependent public use activities. Activities that do not support the Improvement Act of 1997 will be terminated.

- Objective E.1.1: Seek alternative funding and cost saving to address underfunded needs of refuge management.
  - Strategy E.1.1.1: Seek partnerships with state and non-governmental organizations.
  - Strategy E.1.1.2: When appropriate, apply for grants.
  - Strategy E.1.1.3: Reduce costs by eliminating public access to water hose connections and limit where needed to administrative uses only.
  - Strategy E.1.1.4: Reduce number of public access roads requiring routine maintenance by limiting pass-through traffic and permanent or seasonal closures of roads not required for use by refuge visitors.
  - Strategy E.1.1.5: Restrict commercial travel weight limits through the refuge to protect refuge assets.
  - Strategy E.1.1.6: Scale and adjust the number of assets (i.e., buildings, roads, levees, trails, and water control structures) requiring maintenance to match funding and staffing levels.
  - Strategy E.1.1.7: Scale and adjust hours of operation during which the office and visitor center is open to match funding and staffing levels.
  - Strategy E.1.1.8: Construct sufficient equipment storage facilities to provide covered parking for all refuge vehicles and equipment, maximizing lifespan of this equipment.
  - Strategy E.1.1.9: Require rehabilitation and maintenance of involved refuge roads as a condition of the logging bid process and associated special use permits.
  - Stratagy E.1.1.10: Administrative actions tied to the refuge's purposes will be kept in the position of highest priority followed by wildlife-dependent public use activities. Activities that cannot be considered wildlife-dependent will be terminated.

---

Objective E.1.2: Maintain sufficient levels of assets and professionally trained staff to conduct duties related to refuge management, and add an additional six full-time positions to the current refuge staff to achieve the refuge goals.

**Discussion:** Currently, the refuge has 14 positions on the organizational chart consisting of a refuge manager, deputy refuge manager, administrative officer, fire management officer, forester, two forestry technicians, wildlife biologist, biological science technician, park ranger, wildlife officer, and three maintenance workers. The refuge is seeking to restructure existing positions and add four positions for a total of 18 positions.

- Strategy E.1.2.1: Reorganize staff structure to support field activities, continue to seek approval to fill vacancies and add a law enforcement officer (GS-9), three forestry technician/foresters (GS-5/7/9), a wildlife technician (GS-5/7), a maintenance equipment operator (WG-10), a maintenance tractor operator (WG-5), and a maintenance mechanic (WG-10).
- Strategy E.1.2.2: Maintain staff in the following positions: refuge manager, engineering equipment operators, maintenance workers, park rangers, wildlife law enforcement officers, wildlife biologists, foresters, administrative officer, fire management officer, fire forestry technicians, and biological technician.
- Strategy E.1.2.3: Provide opportunities for temporary hires, volunteers, and interns.
- Strategy E.1.2.4: Improve and maintain transportation infrastructure necessary to perform habitat management, resource protection, and compatible public use opportunities.
- Strategy E.1.2.5: Maintain safe and efficient equipment to perform needed refuge operations and maintenance.
- Strategy E.1.2.6: Conduct a Federal Transportation Study on the refuge.
- Objective E.1.3: Support and expand involvement of additional partnerships including The Friends of Noxubee NWR, Inc.
  - Strategy E.1.3.1: Have direct staff involvement with partnership groups.
  - Strategy E.1.3.2: Develop opportunities for involvement in daily refuge management activities.
  - Strategy E.1.3.3: Participate in state and community level disaster preparedness planning.
- Objective E.1.4: Use volunteers (including commuting and resident RV volunteers), and interns to supplement the work of paid professional staff in staffing the visitor center and completing both routine duties and refuge projects.

- 
- Strategy E.1.4.1: Develop resident volunteer camper pads
  - Strategy E.1.4.2: Develop paid or unpaid volunteer coordinator position.
  - Strategy E.1.5.3: Continue to provide and maintain onsite housing for employees, volunteers, and interns, as well as RV pads for resident RV volunteers.

### **Sub-Goal E.2 - Science and Research**

Continue to support and explore greater opportunities to expand on existing baseline information through monitoring and reconnaissance and practice adaptive management to support the purposes for which the refuge was established.

Discussion: Since the land was originally obtained from private landowners starting in 1935 and continuing with the establishment of the Noxubee NWR in 1940, the land both within and outside of the refuge has undergone change. Areas outside the refuge's boundaries have impact on habitat conditions within the refuge. Reasons for changes in waterfowl numbers on the refuge is but one example of both local and landscape impacts. It is the goal that all management directed toward meeting the purposes for which the refuge was established be based on the best available science. Although the refuge has highly educated and trained professionals on its staff, much of their time is spent on the implementation of management actions and the monitoring of outcomes from these actions. The refuge is highly dependent on partners, independent researchers, and university staff for conducting research to improve on those methods and to better understand the refuge's impacts within the greater landscape. When scientific activities are conducted on the refuge by non-Service professionals, regulations require a refuge special use permit be issued by the refuge manager. The priority for issuing of these permits will be to those projects that have a direct tie to the refuge's purposes and management activities and help improve the understanding of the refuge's impact within the greater landscape.

- Objective E.2.1: Partner with MSU and other educational institutions to develop a science program that provides high-quality, scientific-based knowledge for use in making management decisions and developing and training upcoming professionals.
  - Strategy E.2.1.1: Encourage use of the refuge for research and educational activities.
  - Strategy E.2.1.2: Participate in university and school activities.
- Objective E.2.2: Work within the Gulf Coastal Plain and Ozark Landscape Conservation Cooperative to support conservation at both the refuge and landscape scales.
  - Strategy E.2.2.1: Provide staff to serve on planning and development teams.
  - Strategy E.2.2.2: Maintain active participation in cooperative activities.
- Objective E.2.3: Work within the East Gulf Coastal Plain Joint Venture to support conservation at both the refuge and landscape scale.

- 
- Strategy E.2.3.1: Provide staff to serve on planning and development teams.
  - Strategy E.2.3.2: Maintain active participation in cooperative activities.
  - Objective E.2.4: Work with citizen scientists, schools, and non-governmental organizations (e.g., Audubon Society) in development of baseline information.
    - Strategy E.2.4.1: Attend local group meetings.
    - Strategy E.2.4.2: Solicit involvement in refuge management activities.
  - Objective E.2.5: Where appropriate, adopt standardized biological monitoring protocols to contribute data to population assessments beyond the refuge scale, and develop standardized site-specific protocols where none exist.
    - Strategy E.2.5.1: Work with the Refuge System Inventorying and Monitoring Program staff to develop protocols.
    - Strategy E.2.5.2: Develop Inventorying and Monitoring Plan (Policy 701 FW 2).
  - Objective E.2.6: Focus and prioritize biological research and monitoring on those activities that have relevance to ongoing management activities.
    - Strategy E.2.6.1: Develop Inventorying and Monitoring Plan (Policy 701 FW 2).
  - Objective E.2.7: Develop/sustain a close collaborative conservation relationship with the USDA Forest Service and adjacent Tombigbee National Forest to facilitate a greater conservation footprint in the landscape.
    - Strategy E.2.7.1: Meet with USDA Forest Service officials to seek areas of collaboration.
  - Objective E.2.8: Plan and research changes in phenology, shifting distributions of invasive species, potential altered hydrology, water temperature, and other factors that could affect the resources of the refuge due to climate change.
    - Strategy E.2.8.1: Encourage climate change research and monitoring projects.
    - Strategy E.2.8.2: Encourage baseline monitoring.

### **Sub-Goal E.3 - Law Enforcement**

Provide law enforcement for visitor safety, protection of resources, and to ensure public compliance with refuge regulations.

**Discussion:** During Fiscal Year 2013, the refuge received approximately 160,000 visitors including hunters, anglers, and wildlife observers. Among these visitors were residents of almost every state and seven international countries. The majority of the refuge users is local citizens who either live or work within a reasonable driving distance of the refuge. The refuge uses various methods, including signs, pamphlets, and staff, to ensure visitor safety and protect the refuge's natural and cultural resources. The 48,219-acre refuge has one law

---

enforcement officer, but receives assistance by officers with the Mississippi Department of Wildlife, Fisheries and Parks. Unfortunately, vandalism, theft, and resource damage do occur on a routine basis, with recorded impacts often totaling more than \$50,000 yearly in repair and replacement costs and diversion of staff time from duties related to the refuge's purposes.

- Objective E.3.1: Maintain at least one full-time and seek additional wildlife law enforcement officer as members of the permanent refuge staff.
  - Strategy E.3.1.1: Maintain one federal wildlife officer, GL-1801-07/09.
  - Strategy E.3.1.2: Maintain one federal wildlife officer, GL-1801-07.
- Objective E.3.2: Maintain closure of refuge lands to public use (not including activities covered by special use permits) at night except for those activities related to night-time raccoon hunting.
  - Strategy E.3.2.1: Continue closer of refuge to general use from one hour after sunset to one hour before sunrise.
  - Strategy E.3.2.2: Develop gate closure system to enforce night-time closure.
- Objective E.3.3: In addition to any required state or federal permits or licenses, all users must possess the refuge Hunting, Fishing, and Public Use brochure and receipt for public use when on the refuge.
  - Strategy E.3.3.1: Develop electronic hunter permit system for quota hunts.
  - Strategy E.3.3.2: Provide access to updated brochures through electronic formats.
- Objective E.3.4: Maintain programmable radio communications for regular operations and emergency communications with local, county, and state agencies.
  - Strategy E.3.4.1: Ensure each staff has access to radio communication when working in the field.
  - Strategy E.3.4.2: Ensure each law enforcement staff has equipment needed to effectively communicate during times of emergency.
- Objective E.3.5: Continue to partner with local and state law enforcement agencies.
  - Strategy E.3.5.1: Participate in state planning meetings
  - Strategy E.3.5.2: Maintain relations and, if needed, develop agreements to allow effective use of state law enforcement officers on the refuge.

#### **Sub-Goal E.4 - Levees, Roads, and Rights-of-way**

Manage all levees, roads, and rights-of-way without jeopardizing the infrastructure's condition, designed function, and minimally impacting wildlife resources.

---

**Discussion:** Refuge levees, roads, and rights-of-way were established to assist the staff in meeting the purposes for which the refuge was established. The levees were created to impound or redirect water. Roads and rights-of-way were created to allow access to refuge lands for habitat management and biological monitoring. In many cases these assets also serve the secondary purpose of providing public access. Each asset type must be maintained to ensure its longevity and function. Maintenance often provides the additional benefit of protecting the environment from undesirable impacts such as siltation into nearby streams. These assets can additionally become desirable areas to wildlife because of their early successional habitat (i.e., grasses and herbaceous flowers). Wildlife, including insects, deer, and turkey, are drawn to these areas when roadsides are allowed to grow up with wild appearance. Alternatively, undesirable wildlife, such as cowbirds, a bird that practices nest parasitism, may be drawn to these habitats when vegetation is kept well-groomed. Controlling the amount of use by vehicles and other types of transportation is also important as roads, levees, and rights-of-way are often introduction points for invasive and exotic species.

- Objective E.4.1: Manage and, if needed, reduce road infrastructure to the level supported by both maintenance funding and staffing levels that maintains individual roads in good condition.
  - Strategy E.4.1.1: Adopt U.S. Department of Transportation, Federal Highway Administration, Graveled Roads - Maintenance and Design Manual - November 2000 as guide for maintenance of refuge graveled roads.
  - Strategy E.4.1.2: Adaptively manage vehicular traffic to ensure refuge roads continue to serve refuge administrative and public use needs by managing commercial and non-visitor traffic and other forms of transportation that can lead to asset damage, the introduction of exotics and increased maintenance costs.
  - Strategy E.4.1.3: Maintain levees through mechanical, chemical, and prescribed fire to ensure integrity and function of the structure.
  - Strategy E.4.1.4: Where possible, manage rights-of-way for the benefit of wildlife.
- Objective E.4.2: Work with local governments to support the development of improved access to the refuge when appropriate and compatible.
  - Strategy E.4.2.1: Support development of Noxubee Hills Scenic Byway.
  - Strategy E.4.2.2: Develop legal agreement to allow sharing of resources when appropriate.

---

#### **Sub-Goal E.5 - Research Natural Areas**

Eliminate the designation of Research Natural Areas and incorporate "Old Robinson Road Research Natural Area," (consisting of an estimated 46 acres) and the "Morgan Hill Research Natural Area" (consisting of an estimated 67 acres) into surrounding management units.

**Discussion:** Research natural areas were identified to be protected and preserved for research and education. Due to management required to maintain the areas, they did not meet the criteria as research natural areas.

- Objective E.5.1: By 2015, discontinue the recognition of research natural areas.

#### **Sub-Goal E.6 - Habitat Conditions**

Manage refuge habitats to reflect historic conditions in accordance with Service policy.

**Discussion:** The refuge would strive to manage habitats for historic conditions and if necessary under changing climatic conditions would provide the most stable habitat for those native species that would most likely flourish.

- Objective E.6.1: Promote habitat types more reflective of historic forest conditions.
  - Strategy E.6.1.1: Conduct analysis of historic habitat conditions on the refuge.
  - Strategy E.6.1.2: Encourage research to determine and refine characteristics of historic habitat.
- Objective E.6.2: When necessary, use active forest management to reestablish conditions reflective of historic forest conditions.
  - Strategy E.6.2.1: Develop Habitat Management Plan.

---

## V. Plan Implementation

### INTRODUCTION

Refuge lands are managed as defined under the National Wildlife Refuge System Improvement Act of 1997. Congress has distinguished a clear legislative mission of wildlife conservation for all national wildlife refuges. National wildlife refuges, unlike other public lands, are dedicated to the conservation of the Nation's fish and wildlife resources and wildlife-dependent recreational uses. Priority projects emphasize the protection and enhancement of fish and wildlife species first and foremost, but considerable emphasis is placed on balancing the needs and demands for wildlife-dependent recreation and environmental education.

To accomplish the purpose, vision, goals, and objectives contained in this CCP for the refuge, this section identifies projects, funding and personnel needs, volunteers, partnership opportunities, step-down management plans, a monitoring and adaptive management plan, and plan reviews and revisions.

### PROPOSED PROJECTS

Listed below are the proposed project summaries and their associated costs for fish and wildlife population management, habitat management, resource protection, visitor services, and refuge administration over the next 15 years. This proposed project list reflects the priority needs identified by the public, planning team, and refuge staff based upon available information. These projects were generated for the purpose of achieving the refuge's objectives and strategies. The primary linkages of these projects to those planning elements are identified in each summary (Table 7).

#### FISH AND WILDLIFE POPULATION AND HABITAT MANAGEMENT

**Project 1.** Participate in objective based monitoring programs, data collection and reconnaissance in concert with national protocol and procedures.

The refuge will coordinate with the Inventorying and Monitoring Network and incorporate efforts by partners and volunteers to expand on baseline data to help reach the goals for which the refuge was established. The refuge has highly educated and trained professionals on its staff; much of their time is spent on the implementation of management actions and monitoring and conducting reconnaissance of outcomes from these actions. Independent and university researchers conduct significant research on the refuge, and the refuge's special use permit process helps ensure these efforts improve understanding of the refuge's impacts within the greater landscape. Specific projects that will receive priority efforts include, but not limited to, monitoring paddlefish, investigating red-cockaded woodpecker population dynamics, monitoring to improve sustainability of fisheries within the lakes, waterfowl monitoring, and resident and migratory wildlife population monitoring, including bat species. Also included are floristic inventorying, forest habitat inventorying and monitoring, forest health monitoring, and water quality monitoring.

*Linkage Objectives:* A.1.1-A.8.3, D.5.1-2, E.2.1-E.2.7

**Project 2.** Suppress, control, monitor, and implement procedures to minimize spread of nuisance, exotic, and invasive plant and animal species.

---

A basic tenant of the Improvement Act is management for biological diversity and integrity. The refuge has several documented native and nonnative invasive, exotic, and nuisance animal species and a high likelihood of free-ranging feral animals. These species impact the refuge's ability to carry out desired management objectives to varying degrees. Some of the specific projects include bark beetle monitoring, beaver dam removal, beaver trapping, control of American Lotus within refuge wetlands, control of hardwoods within areas managed for RCWs, and removal of exotic plants, including, but not limited to, cogon grass, Japanese climbing fern, and bicolor lespedeza.

*Objectives:* A.6.6, A.8.1-3, E.1.2, E.2.1-8

#### **Project 3.** Fire Management Program – Fire Lines

Prescribed fire is a critical management tool for habitat management and the control of early successional woody vegetation within pine stands used by RCWs. Fire lines are the primary method for protecting adjacent habitats from fire and give the ability to better control prescribed fire units. Two of the specific projects include establishing new fire lines around the pine regeneration areas essential for successful stand replacement and establishing fire lines around riparian and cultural sites that could be harmed by fire.

*Objectives:* B.1.1-3, B.2, C.2.1, C.5.1, E.1.2

#### **Project 4.** Hydrologic Monitoring and Restoration – Restoration of Fish Passage

The hydrology of the refuge has been manipulated and changed since the refuge was established. Large hydrologic changes were created during the establishment of the refuge's lakes and GTRs. Due to changes both in and outside the refuge, water quality has suffered. Restoration and adjustments in management should continue to improve habitat for fish and other aquatic life when practiced under a balanced approach with other refuge resources. Some of the specific projects include improving the hydrologic connection for fish passage between rivers and man-made water-bodies, including Bluff and Loakfoma lakes and the GTRs.

*Objectives:* A.7.1-A.7.5, B.2, B.3.1-3, E.1.2

#### **Project 4a.** Hydrologic Monitoring and Restoration – Restoration of Woodland Water Flow

The hydrology of the refuge has been manipulated and changed since the refuge was established. Smaller changes have occurred when springs and wetlands were manipulated to provide drinking water or for the development of roads and trails. Some of the specific projects include repair of low water crossings on Robinson and Goose Pen Roads and establishing low water crossings on Dummy Line, Section Line, and Williams Roads to improve hydrological functions in these areas.

*Objectives:* A.8.1, B.2.1-2, B.3.1-3, E.1.1-2

#### **Project 4b.** Hydrologic Monitoring and Restoration – Removal of Obsolete Structures

The hydrology of the refuge has been manipulated and changed since the refuge was established, often under the goal of providing habitat for waterfowl. Many moist-soil areas

---

established under this goal have since been abandoned with local declines in wintering waterfowl numbers. Targeted sites for restoration are in areas needed by RCWs. Returning these sites to their natural hydrology would encourage establishment of better foraging habitat for these birds. Specific projects include but not limited to the removal of levees and water control structures for all fields immediately west of Loakfoma Lake, areas within the Smith Fields, and northern levee of GTR-3 south of the Noxubee Wilderness Area.

*Objectives:* A.8.1-3, B.2.1-2, B.3.1-3, E.1.1-2

**Project 5. Creation of Artificial Bat Roost**

In association with restoration of the man-made borrow pit located near Bevill's Hill, the refuge will investigate the concept of creating one or more artificial bat roosts constructed from precast concrete culvert pipes. The refuge will work with biologists and other scientists familiar with the needs of and threats to resident bats.

*Objectives:* A.6.3, B.2.1, E.1.1-2, E.2.1-8

*RESOURCE PROTECTION*

**Project 6. Land Acquisition**

The refuge will rank and attempt to acquire all existing private lands within the acquisition boundary from willing sellers. Land swap should be considered to exchange existing low priority fee-title lands for high-priority inholdings.

*Objectives:* C.3.1, E.1.2

**Project 7. Cultural Resource Surveys**

Systematic inventories should be conducted at the necessary level of intensity to adequately document the nature, extent, and condition of significant cultural resources. Refuge staff will work with the Service Archaeologist, SHPO, and tribes to assign priorities for systematic surveys. At the earliest possible time during the planning of a particular activity, it is necessary to determine what steps and levels of funding are necessary to comply with the inventory, evaluation, and mitigation procedures addressed in 36 CFR 800. Funding will be sought for a refuge-wide archaeological survey and site specific surveys will continue to address priority projects.

*Objectives:* C.1.1-5, E.1.2

*VISITOR SERVICES*

**Project 8. Managing Public Uses – “Connecting People with Nature” area**

The refuge would establish two zones of public use areas by creating the “Connecting People with Nature” area located in the areas around Bluff and Loakfoma lakes and an “Experiencing Nature” area located over the remaining area of the refuge. The creation of these areas would encourage recreational opportunities that remain compatible with the purposes for which the refuge was established and the mission of the Service. Within the “Connecting People with Nature” area, specific projects would include the creation of a 6-mile loop trail

---

system. The initial segment would include a paved walkway from the improved Bluff Lake boat ramp to the Smith Fields. The trail would run along the shoreline of Bluff Lake, intersect the Cypress Cove Boardwalk, and follow the existing fire line past the Woodpecker Trail (~3 miles), intersecting with the Goose Overlook. The trail would leave the Goose Overlook and run along the north side of Bluff Lake Road until crossing onto the Smith Field Road. An equal or lesser developed trail would then follow the Smith Field Road south, joining with an existing fire line toward Loakfoma Creek. A new trail would be created along the north side of Loakfoma Creek until reaching Ewing Road. Following Ewing Road south until reaching the refuge boundary at Loakfoma Lake, a new trail would be created along the southern end of the lake and then turn northward returning visitors to the improved Bluff Lake boat ramp. This new trail would include a spur trail leading back along the west side of Loakfoma Lake. This new trail system would allow wildlife observation by way of both walking and bicycling. The undeveloped boat ramp into Bluff Lake north of Doyle's Arm would be eliminated.

There would also be improvements to existing facilities including an extension made to the deck at the back of Visitor's Center to provide a floating dock. The existing Beaver Dam Trail would be improved to include a loop along the River Road. This new trail loop would measure approximately 4.5 miles. The handicapped access on Loakfoma fishing jetty and ramp would be improved along with the Morgan Hill parking area and trail. Possible expansion would be made to the parking areas along Bluff Lake Road at Doyle's Arm and other locations along the road. Improvement to the special event youth fishing ponds would continue, with installation of benches and pavilions. Access to the west of Bluff Lake for improved wildlife observation would include establishment of a new bypass trail between Loakfoma Road and Ewing Road, thus avoiding wildlife disturbance at the Goose Overlook fields. Up to three, no water, composting vault public restrooms would be made available along the improved trails.

*Objectives:* D.1.1-8, D.2.1-4, D.3.1-2, D.4.1-2, D.5.1-2, D.6.1-5, E.1.1-2

**Project 9.** Improved fishing access at Ross Branch Reservoir

Ross Branch Reservoir offers an isolated lake fishing experience that may be well-suited toward handicapped anglers requiring a greater level of infrastructure. The current parking area, dock, and ramp would be improved to provide wheeled chair access through construction of modern floating dock and concrete access ramp.

*Objectives:* D.2.4, E.1.2

**Project 10.** Improved Public Information Stations

Additional refuge kiosks and hunter check stations will be created throughout the refuge. These stations will be placed at key refuge entry points and distributed at convenient locations within the refuge for users.

*Objectives:* D.1.2, D.1.7, D.4.1-2, D.7.1-3, E.1.1-2

**Project 11.** Improve Vehicle Traffic Flow for Wildlife

The refuge will create controlled access points allowing for public access but limiting use of refuge roads by pass-through commuter traffic. Refuge entry points will be located at the following areas: both ends of Bluff Lake Road, Brookville Road near the refuge boundary at Morgan Hill, Dummy Line Road and Singleton Road, Clearman Road, Ross Branch Road,

---

Roberts Road, Bevill's Hill Road, White Road, Keaton Tower Road, and Cedar Grove Road. All other roads will be continued to be maintained as administrative access only. Gates will be used to control access at all other refuge-maintained road entry points. Speeds on refuge roads will also be limited to 25 miles per hour unless otherwise posted. Speed control measures may be used to address site-specific vehicle speeding issues.

*Objectives:* D.1.7, E.1.2

## REFUGE ADMINISTRATION

### **Project 12.** Refuge Management Projects – Real Property Assets

Each man-made feature on the refuge that requires operation and maintenance is considered a Real Property Asset within the Service Asset and Maintenance Management System (SAMMS). At the current time, the refuge has 308 assets listed within this system with a total replacement cost of approximately \$140 million. Annual maintenance costs are estimated at approximately \$485,000. In Fiscal Year 2013, the refuge received \$166,670 in maintenance funding. This limited funding will be utilized for priority maintenance and improvements. Refuge assets will be prioritized and maintained, favoring those tied to the purposes for which the refuge was established and then those that support public uses.

*Objectives:* E.1.1-2

### **Project 13.** Refuge Management Projects – New Projects

In addition to recognized maintenance needs, additional refuge management projects will be addressed including reclamation of an existing borrow pit located near Bluff Lake Road and Bevils Hill Road, creation of a second large equipment shed to provide adequate covered storage for vehicles, farm tractors and heavy equipment, and installing security fencing and gates to protect all facilities (Note: This new project would be covered under additional NEPA documentation and process if needed).

*Objectives:* E.1.1-2

### **Project 14.** Refuge Management Projects – Control of Feral Hogs

Feral hogs have recently begun to populate portions of the refuge. These hogs have a potential to multiply and spread at an alarming rate if not controlled. Feral hogs tend to out-compete native wildlife for critical food resources and are known to cause the predation of ground-nesting birds. Additionally, feral hogs carry diseases that can be spread to both humans and domestic livestock. This project would employ temporary seasonal technicians to conduct feral hog control activities. The refuge would also work with the USDA to control hogs on the refuge. This effort would need to occur as soon as possible before feral hog populations reach uncontrollable levels and distribution.

*Objectives:* A.8.1, A.8.3, E.1.1

### **Project 15.** Refuge Management Projects – Removal of two current employee housing buildings and replace with a new bunkhouse of similar square footage.

---

Providing housing for interns, long-term volunteers, and visiting staff and researchers helps ensure personnel safety and facilitates the gathering of quality data and completion of high-priority projects. Current housing was constructed in the 1960s. New housing would offer higher efficiency, compliance with ADA requirements, and lower maintenance costs. One house would remain as potential housing for new permanent employees.

*Objectives:* E.1.1-2

**Project 16.** Refuge Management Projects – Create deep water habitat and new cypress islands within Bluff Lake

Refuge staff will create up to six deep water areas each measuring approximately 120 feet by 400 feet in width and length. Ponds will have a depth of up to 8 feet and use the spoil material in the creation of islands suitable for the establishment of cypress and future waterbird nesting sites. Sites will be spaced toward the lakes interior and used to support fisheries during extended periods of low water conditions.

*Objectives:* A.2.1, A.2.2, A.7.2, B.3.4, D.2.1

**Project 17.** Refuge Management Projects – Creation of Uneven-aged Pine Dominated Forests.

The refuge staff will work with research scientist to develop methods for managing pine-dominated forests for red-cockaded woodpeckers for sustainable good quality foraging habitat using uneven-aged forestry methods. Work may include the establishment of both on- and off-site partnerships.

*Objectives:* A.4.2; B.1.1; B.1.2; B.1.3

**Table 7. Summary of Projects**

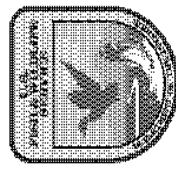

#	Project Title	First Year Cost	Recurring Annual Cost	Additional Staff FTE'S
1	Science-based Inventorying and monitoring of Wildlife Populations A. Improve Halbert Lake for Paddlefish B. RCW Monitoring C. Fisheries Monitoring D. Water Quality Monitoring E. Hunt Program Population Monitoring F. Floristic Inventorying G. Forest Habitat Monitoring H. Waterfowl Monitoring	470,000	320,000	(4) GS-5/7
2	Suppress and control, develop maps to depict infestations, and implement procedures to minimize spread of nuisance, exotic, and invasive plants and animal species. A. Bark Beetle Surveys B. Removing Beaver Dams C. Trapping Beavers D. Trapping Feral Hogs E. Removal of up to 60% of American Lotus	35,000	35,000	
3	Fire Management Program Operations (new fire lines around regeneration areas)	30,000	30,000	
4	Hydrologic Monitoring and Restoration A. Repair Low Water Crossings on Robinson Road Levee B. Improve Hydrologic Connection Between Water Control Pool and Spillway C. Restore Natural Hydrology on Corn Field Moist-Soil Area and Smith Field	100,000	1.3M	
5	Creation of Artificial Bat Roost	100,000	1,000

#	Project Title	First Year Cost	Recurring Annual Cost	Additional Staff FTE'S
13	Refuge Management Projects- New Projects	300,000		
14	Refuge Management Projects- Control of Feral Hogs	100,000	100,000	(1) GS-5
15	Refuge Management Projects- Removal of Two Current Employee Housing Buildings and Replace with a New Bunkhouse of Similar Square Footage	1,500,000	1,000	
16	Refuge Management Projects- Create Deep Water Habitat and New Cypress Islands within Bluff Lake	200,000		
17	Refuge Management Projects- Creation of Uneven-aged Pine Dominated Forests	280,000	60,000	

In the preceding chapters, this CCP for the refuge has set forth a vision for the refuge and outlined the management goals, objectives, and strategies needed to realize that vision. Full implementation of the vision will require additions to the organizational structure of the refuge above the 11 current employees. Existing staff will intensify their efforts and new staff members will enable the refuge to expand its wildlife and habitat conservation, resource protection, enforcement, and public education and outreach endeavors. The following table and organizational chart (Figure 14) identifies the additional positions and future structure of the refuge (Table 8).

United States Fish and Wildlife Service  
Southeast Region  
Regional Chief, National Wildlife Refuge System  
Sam D. Hamilton Noxubee National Wildlife Refuge Complex

Org Code: FF04RMNX00

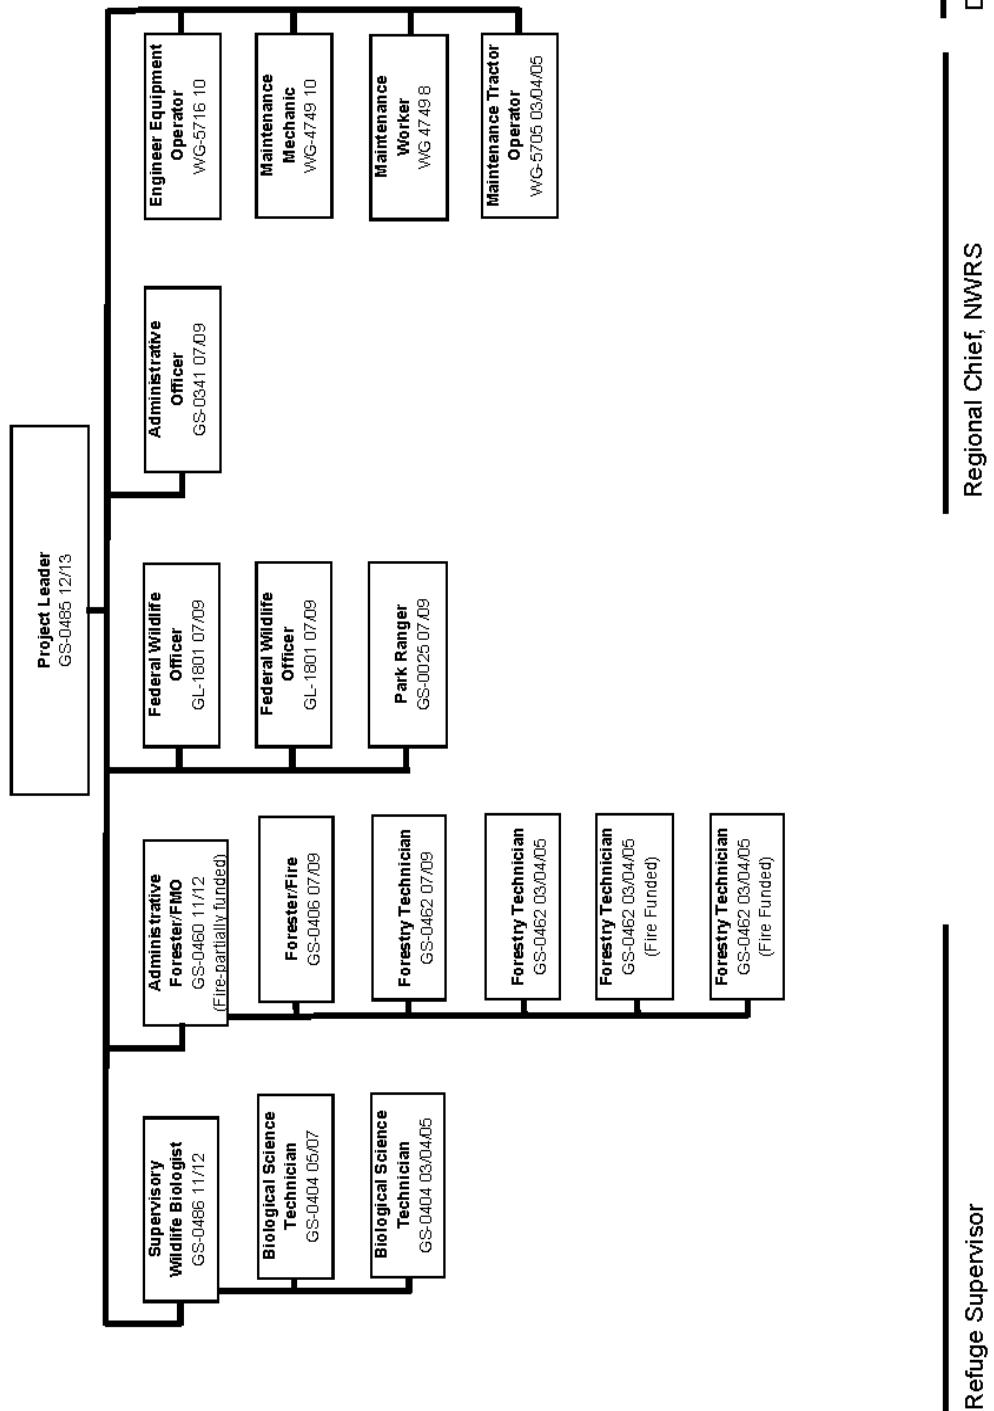

Figure 14. Sam D. Hamilton Noxubee NWR Complex Organizational Chart 2013

---

**Table 8. Additional new personnel identified to implement the CCP for Sam D. Hamilton Noxubee NWR**

<b>Position Title</b>	<b>Grade</b>	<b>Funding Required</b>
<b>Law Enforcement Officer</b>	<b>GS- 9</b>	<b>\$62,297</b>
<b>Forestry Technician/Forester</b>	<b>(3) GS- 5/7/9</b>	<b>\$186,891</b>
<b>Wildlife Technician</b>	<b>GS- 5/7</b>	<b>\$41,122</b>
<b>Engineering Equipment Operator</b>	<b>WG-10</b>	<b>\$45,288</b>
<b>Maintenance Tractor Operator</b>	<b>WG-5</b>	<b>\$34,498</b>
<b>Maintenance Mechanic</b>	<b>WG- 10</b>	<b>\$45,288</b>

## **PARTNERSHIP/VOLUNTEER OPPORTUNITIES**

A key element of this CCP is to establish and strengthen partnerships with local volunteers, landowners, private organizations, non-governmental organizations, county government, state and federal natural resource agencies, and Native American tribes. In the immediate vicinity of the refuge, opportunities exist to establish and grow partnerships with Wild Turkey Federation, Friends of Noxubee Refuge, Inc., Quail Unlimited, Quail Forever, Ducks Unlimited, The Nature Conservancy, C.A. Barge Timberlands, L.P., Bass Pro Shops, Audubon Society, Mississippi State University, USDA Forest Service, National Park Service, and Mississippi Department of Wildlife, Fisheries and Parks.

## **STEP-DOWN MANAGEMENT PLANS**

A comprehensive conservation plan is a strategic plan that guides the direction of the refuge. A step-down management plan provides specific guidance on activities, such as habitat, fire, and visitor services. These plans (Table 9) are also developed in accordance with the National Environmental Policy Act, which requires the identification and evaluation of alternatives and public review and involvement prior to their implementation.

**Table 9. Step-down management plans related to the goals and objectives of the CCP**

<b>Step-down Plan</b>	<b>Completion Date</b>
Habitat Management Plan	Attached
Visitor Services Plan	Attached
Hunt Plan	Attached
Integrated Pest Management Plan	Attached
Fire Management Plan	2015
Inventorying and Monitoring Plan	TBD
Cultural Resources Management Plan	2017

---

## **MONITORING AND ADAPTIVE MANAGEMENT**

Adaptive management is a flexible approach to long-term management of biotic resources that is directed over time by the results of ongoing trials and monitoring activities. More specifically, adaptive management is a process by which projects are implemented within a framework of scientifically driven experiments to test the predictions and assumptions outlined within a plan.

To apply adaptive management, specific surveying, inventorying, and monitoring protocols will be adopted for the refuge. The habitat management strategies will be systematically evaluated to determine management effects on wildlife populations. This information will be used to refine approaches and determine how effectively the objectives are being accomplished. Evaluations will include ecosystem team and other appropriate partner participation. If monitoring and evaluating indicate undesirable effects for target and non-target species and/or communities, alterations to the management projects will be made. Subsequently, the CCP will be revised. Specific monitoring and evaluating activities will be described in the step-down management plans.

## **PLAN PROGRESS, REVIEW AND REVISION**

The Final CCP will be reviewed annually as the refuge's annual work plans are developed and budgets are received. Progress towards stated goals and objectives is expected to be incremental with time and positive in direction. The level of success will be dependent on staff and budget resources made available to the refuge. This CCP is augmented by detailed step-down management plans to address the completion of specific strategies in support of the refuge's goals and objectives. A revision may occur if and when conditions change or significant information becomes available, to such an extent to make the current plan obsolete. Revisions to the Final CCP and the step-down management plans will be subject to public review and NEPA compliance.

---

## APPENDICES

### *Appendix A. Glossary*

<b>Adaptive Management:</b>	Refers to a process in which policy decisions are implemented within a framework of scientifically driven experiments to test predictions and assumptions inherent in a management plan. Analysis of results helps managers determine whether current management should continue as is or whether it should be modified to achieve desired conditions.
<b>Alluvial:</b>	Sediment transported and deposited in a delta or riverbed by flowing water.
<b>Alternative:</b>	1. A reasonable way to fix the identified problem or satisfy the stated need (40 CFR 1500.2). 2. Alternatives are different sets of objectives and strategies or means of achieving refuge purposes and goals, helping fulfill the Refuge System mission, and resolving issues (Service Manual 602 FW 1.6B).
<b>Anadromous:</b>	Migratory fishes that spend most of their lives in the sea and migrate to fresh water to breed.
<b>Basal Area:</b>	The area of a horizontal cross section of a tree's stem, generally measured at breast height.
<b>Biological Diversity:</b>	The variety of life and its processes, including the variety of living organisms, the genetic differences among them, and the communities and ecosystems in which they occur (Service Manual 052 FW 1. 12B). The System's focus is on indigenous species, biotic communities, and ecological processes. Also referred to as biodiversity.
<b>Carrying Capacity:</b>	The maximum population of a species able to be supported by a habitat or area.
<b>Categorical Exclusion:</b>	A category of actions that does not individually or cumulatively have a significant effect on the human environment and have been found to have no such effect in procedures adopted by a federal agency pursuant to the National Environmental Policy Act (40 CFR 1508.4).
<b>CFR:</b>	Code of Federal Regulations.

---

<b>Compatible Use:</b>	A proposed or existing wildlife-dependent recreational use or any other use of a national wildlife refuge that, based on sound professional judgment, will not materially interfere with or detract from the fulfillment of the National Wildlife Refuge System mission or the purpose(s) of the national wildlife refuge [50 CFR 25.12 (a)]. A compatibility determination supports the selection of compatible uses and identifies stipulations or limits necessary to ensure compatibility.
<b>Comprehensive Conservation Plan:</b>	A document that describes the desired future conditions of a refuge or planning unit and provides long-range guidance and management direction to achieve the purposes of the refuge; helps fulfill the mission of the Refuge System; maintains and, where appropriate, restores the ecological integrity of each refuge and the Refuge System; helps achieve the goals of the National Wilderness Preservation System; and meets other mandates (Service Manual 602 FW 1.6 E).
<b>Concern:</b>	See Issue
<b>Cover Type:</b>	The present vegetation of an area.
<b>Cultural Resource Inventory:</b>	A professionally conducted study designed to locate and evaluate evidence of cultural resources present within a defined geographic area. Inventories may involve various levels, including background literature search, comprehensive field examination to identify all exposed physical manifestations of cultural resources, or sample inventory to project site distribution and density over a larger area. Evaluation of identified cultural resources to determine eligibility for the National Register follows the criteria found in 36 CFR 60.4 (Service Manual 614 FW 1.7).
<b>Cultural Resource Overview:</b>	A comprehensive document prepared for a field office that discusses, among other things, its prehistory and cultural history, the nature and extent of known cultural resources, previous research, management objectives, resource management conflicts or issues, and a general statement on how program objectives should be met and conflicts resolved. An overview should reference or incorporate information from a field office's background or literature search described in Section VIII of the Cultural Resource Management Handbook (Service Manual 614 FW 1.7).
<b>Cultural Resources:</b>	The remains of sites, structures, or objects used by people in the past.
<b>Designated Wilderness Area:</b>	An area designated by the U.S. Congress to be managed as part of the National Wilderness Preservation System (Draft Service Manual 610 FW 1.5).

---

<b>Duck Energy Day (DED)s:</b>	Duck-energy days are the number of dabbling ducks (tribe: Anatini) that potentially can be sustained energetically in a wetland for a specified duration.
<b>Disturbance:</b>	Significant alteration of habitat structure or composition. May be natural (e.g., fire) or human-caused events (e.g., aircraft overflight).
<b>Ecosystem:</b>	A dynamic and interrelating complex of plant and animal communities and their associated non-living environment.
<b>Ecosystem Management:</b>	Management of natural resources using system-wide concepts to ensure that all plants and animals in ecosystems are maintained at viable levels in native habitats and basic ecosystem processes are perpetuated indefinitely.
<b>Endangered Species (Federal):</b>	A plant or animal species listed under the Endangered Species Act that is in danger of extinction throughout all or a significant portion of its range.
<b>Endangered Species (State):</b>	A plant or animal species in danger of becoming extinct or extirpated in the state within the near future if factors contributing to its decline continue. Populations of these species are at critically low levels or their habitats have been degraded or depleted to a significant degree.
<b>Environmental Assessment (EA):</b>	A concise public document, prepared in compliance with the National Environmental Policy Act, that briefly discusses the purpose and need for an action, alternatives to such action, and provides sufficient evidence and analysis of impacts to determine whether to prepare an environmental impact statement or finding of no significant impact (40 CFR 1508.9).
<b>Environmental Impact Statement (EIS):</b>	A detailed written statement required by section 102(2)(C) of the National Environmental Policy Act, analyzing the environmental impacts of a proposed action, adverse effects of the project that cannot be avoided, alternative courses of action, short-term uses of the environment versus the maintenance and enhancement of long-term productivity, and any irreversible and irretrievable commitment of resources (40 CFR 1508.11).
<b>Estuary:</b>	The wide lower course of a river into which the tides flow. The area where the tide meets a river current.

---

<b>Finding of No Significant Impact (FONSI):</b>	A document prepared in compliance with the National Environmental Policy Act, supported by an environmental assessment, that briefly presents why a federal action will have no significant effect on the human environment and for which an environmental impact statement, therefore, will not be prepared (40 CFR 1508.13).
<b>Fire Line</b>	An area cleared of all of its burnable fuel to prevent the spread of fire from one area into another area. Soils can be exposed using heavy equipment (i.e., bulldozers, fire plows) when permanent lines are needed or through handtools when temporary lines are more desirable to meet management goals and objectives.
<b>Goal:</b>	Descriptive, open-ended, and often broad statement of desired future conditions that conveys a purpose but does not define measurable units (Service Manual 620 FW 1.6J).
<b>Habitat:</b>	Suite of existing environmental conditions required by an organism for survival and reproduction. The place where an organism typically lives.
<b>Habitat Restoration:</b>	Management emphasis designed to move ecosystems to desired conditions and processes, and/or to healthy ecosystems.
<b>Habitat Type:</b>	See Vegetation Type.
<b>Improvement Act:</b>	The National Wildlife Refuge System Improvement Act of 1997.
<b>Informed Consent:</b>	The grudging willingness of opponents to “go along” with a course of action that they actually oppose (Bleiker).
<b>Issue:</b>	Any unsettled matter that requires a management decision [e.g., an initiative, opportunity, resource management problem, threat to the resources of the unit, conflict in uses, public concern, or other presence of an undesirable resource condition (Service Manual 602 FW 1.6K)].
<b>Management Alternative:</b>	See Alternative
<b>Management Concern:</b>	See Issue
<b>Management Opportunity:</b>	See Issue
<b>Migration:</b>	The seasonal movement from one area to another and back.
<b>Mission Statement:</b>	Succinct statement of the unit’s purpose and reason for being.

---

<b>Monitoring:</b>	The process of collecting information to track changes of selected parameters over time.
<b>National Environmental Policy Act of 1969 (NEPA):</b>	Requires all agencies, including the Service, to examine the environmental impacts of their actions, incorporate environmental information, and use public participation in the planning and implementation of all actions. Federal agencies must integrate NEPA with other planning requirements, and prepare appropriate NEPA documents to facilitate better environmental decision-making (40 CFR 1500).
<b>National Wildlife Refuge System Improvement Act of 1997 (Public Law 105-57):</b>	Under the Refuge Improvement Act, the Fish and Wildlife Service is required to develop 15-year comprehensive conservation plans for all national wildlife refuges outside Alaska. The Act also describes the six public uses given priority status within the Refuge System (i.e., hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation).
<b>National Wildlife Refuge System Mission:</b>	The mission is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.
<b>National Wildlife Refuge System:</b>	Various categories of areas administered by the Secretary of the Interior for the conservation of fish and wildlife, including species threatened with extinction; all lands, waters, and interests therein administered by the Secretary as wildlife refuges; areas for the protection and conservation of fish and wildlife that are threatened with extinction; wildlife ranges; game ranges; wildlife management areas; or waterfowl production areas.
<b>National Wildlife Refuge:</b>	A designated area of land, water, or an interest in land or water within the Refuge System.
<b>Native Species:</b>	Species that normally live and thrive in a particular ecosystem.
<b>Natural Resource:</b>	Materials and components that can be found within the environment. A natural resource may exist as a separate entity such as water or air, or as a living organism such as a salamander.
<b>Noxious Weed:</b>	A plant species designated by federal or state law as generally possessing one or more of the following characteristics: aggressive or difficult to manage; parasitic; a carrier or host of serious insect or disease; or non-native, new, or not common to the United States. According to the Federal Noxious Weed Act (P.L. 93-639), a noxious weed is one that causes disease or had adverse effects on man or his environment and therefore is detrimental to the agriculture and commerce of the United States and to the public health.

---

<b>Objective:</b>	A concise statement of what we want to achieve, how much we want to achieve, when and where we want to achieve it, and who is responsible for the work. Objectives derive from goals and provide the basis for determining strategies, monitoring refuge accomplishments, and evaluating the success of strategies. Making objectives attainable, time-specific, and measurable (Service Manual 602 FW 1.6N).
<b>RCW Partition:</b>	Partitions are spatially created by 0.25 mile and 0.5 mile radius circles drawn around the cluster centers.
<b>Plant Association:</b>	A classification of plant communities based on the similarity in dominants of all layers of vascular species in a climax community.
<b>Plant Community:</b>	An assemblage of plant species unique in its composition; occurs in particular locations under particular influences; a reflection or integration of the environmental influences on the site such as soils, temperature, elevation, solar radiation, slope, aspect, and rainfall; denotes a general kind of climax plant community.
<b>Preferred Alternative:</b>	This is the alternative determined (by the decision-maker) to best achieve the refuge purpose, vision, and goals; contributes to the Refuge System mission, addresses the significant issues; and is consistent with principles of sound fish and wildlife management.
<b>Prescribed Fire:</b>	The application of fire to wildland fuels to achieve identified land use objectives (Service Manual 621 FW 1.7). May occur from natural ignition or intentional ignition.
<b>Priority Species:</b>	Fish and wildlife species that require protective measures and/or management guidelines to ensure their perpetuation. Priority species include the following: (1) State-listed and candidate species; (2) species or groups of animals susceptible to significant population declines within a specific area or statewide by virtue of their inclination to aggregate (e.g., seabird colonies); and (3) species of recreation, commercial, and/or tribal importance.
<b>Public Involvement Plan:</b>	Broad long-term guidance for involving the public in the comprehensive conservation planning process.
<b>Public Involvement:</b>	A process that offers impacted and interested individuals and organizations an opportunity to become informed about, and to express their opinions on Service actions and policies. In the process, these views are studied thoroughly and thoughtful consideration of public views is given in shaping decisions for refuge management.

---

<b>Public:</b>	Individuals, organizations, and groups; officials of federal, state, and local government agencies; Indian tribes; and foreign nations. It may include anyone outside the core planning team. It includes those who may or may not have indicated an interest in service issues and those who do or do not realize that Service decisions may affect them.
<b>Purposes of the Refuge:</b>	"The purposes specified in or derived from the law, proclamation, executive order, agreement, public land order, donation document, or administrative memorandum establishing, authorizing, or expanding a refuge, refuge unit, or refuge sub-unit." For refuges that encompass congressionally designated wilderness, the purposes of the Wilderness Act are additional purposes of the refuge (Service Manual 602 FW 106 S).
<b>Recommended Wilderness:</b>	Areas studied and found suitable for wilderness designation by both the Director of the Fish and Wildlife Service and the Secretary of the Department of the Interior, and recommended for designation by the President to Congress. These areas await only legislative action by Congress in order to become part of the Wilderness System. Such areas are also referred to as "pending in Congress" (Draft Service Manual 610 FW 1.5).
<b>Record of Decision (ROD):</b>	A concise public record of decision prepared by the federal agency, pursuant to NEPA, that contains a statement of the decision, identification of all alternatives considered, identification of the environmentally preferable alternative, a statement as to whether all practical means to avoid or minimize environmental harm from the alternative selected have been adopted (and if not, why they were not), and a summary of monitoring and enforcement where applicable for any mitigation (40 CFR 1505.2).
<b>Refuge Goal:</b>	See Goal
<b>Refuge Purposes:</b>	See Purposes of the Refuge
<b>Songbirds:</b> (Also Passerines)	A category of birds that is medium to small, perching landbirds. Most are territorial singers and migratory.
<b>Step-down Management Plan:</b>	A plan that provides specific guidance on management subjects (e.g., habitat, public use, fire, and safety) or groups of related subjects. It describes strategies and implementation schedules for meeting CCP goals and objectives (Service Manual 602 FW 1.6 U).
<b>Strategy:</b>	A specific action, tool, technique, or combination of actions, tools, and techniques used to meet unit objectives (Service Manual 602 FW 1.6 U).

---

<b>Study Area:</b>	The area reviewed in detail for wildlife, habitat, and public use potential. For purposes of this CCP, the study area includes the lands within the currently approved refuge boundary and potential refuge expansion areas.
<b>Threatened Species (Federal):</b>	Species listed under the Endangered Species Act that are likely to become endangered within the foreseeable future throughout all or a significant portion of their range.
<b>Threatened Species (State):</b>	A plant or animal species likely to become endangered in the state within the near future if factors contributing to population decline or habitat degradation or loss continue.
<b>Tiering:</b>	The coverage of general matters in broader environmental impact statements with subsequent narrower statements of environmental analysis, incorporating by reference, the general discussions and concentrating on specific issues (40 CFR 1508.28).
<b>U.S. Fish and Wildlife Service Mission:</b>	The mission of the U.S. Fish and Wildlife Service is working with others to conserve, protect, and enhance fish and wildlife and their habitats for the continuing benefit of the American people.
<b>Unit Objective:</b>	See Objective
<b>Vegetation Type, Habitat Type, Forest Cover Type:</b>	A land classification system based upon the concept of distinct plant associations.
<b>Vision Statement:</b>	A concise statement of what the planning unit should be, or what we hope to do, based primarily upon the Refuge System mission and specific refuge purposes, and other mandates. We will tie the vision statement for the refuge to the mission of the Refuge System; the purpose(s) of the refuge; the maintenance or restoration of the ecological integrity of each refuge and the Refuge System; and other mandates (Service Manual 602 FW 1.6 Z).
<b>Wilderness Study Areas:</b>	Lands and waters identified through inventory as meeting the definition of wilderness and undergoing evaluation for recommendation for inclusion in the Wilderness System. A study area must meet the following criteria: <ul style="list-style-type: none"> <li>▪ Generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable;</li> <li>▪ Has outstanding opportunities for solitude or a primitive and unconfined type of recreation; and</li> <li>▪ Has at least 5,000 contiguous roadless acres or is sufficient in size as to make practicable its preservation and use in an unimpaired condition (Draft Service Manual 610 FW 1.5).</li> </ul>

- 
- Wilderness:** See Designated Wilderness
- Wildfire:** A free-burning fire requiring a suppression response; all fire other than prescribed fire that occurs on wildlands (Service Manual 621 FW 1.7).
- Wildland Fire:** Every wildland fire is either a wildfire or a prescribed fire (Service Manual 621 FW 1.3)

## *Appendix C. Relevant Legal Mandates and Executive Orders*

<b>STATUTE</b>	<b>DESCRIPTION</b>
<i>Administrative Procedures Act (1946)</i>	Outlines administrative procedures to be followed by federal agencies with respect to identification of information to be made public; publication of material in the Federal Register; maintenance of records; attendance and notification requirements for specific meetings and hearings; issuance of licenses; and review of agency actions.
<i>American Antiquities Act of 1906</i>	Provides penalties for unauthorized collection, excavation, or destruction of historic or prehistoric ruins, monuments, or objects of antiquity on lands owned or controlled by the United States. The Act authorizes the President to designate as national monuments objects or areas of historic or scientific interest on lands owned or controlled by the United States.
<i>American Indian Religious Freedom Act of 1978</i>	Protects the inherent right of Native Americans to believe, express, and exercise their traditional religions, including access to important sites, use and possession of sacred objects, and the freedom to worship through ceremonial and traditional rites.
<i>Americans With Disabilities Act of 1990</i>	Intended to prevent discrimination of and make American society more accessible to people with disabilities. The Act requires reasonable accommodations to be made in employment, public services, public accommodations, and telecommunications for persons with disabilities.
<i>Anadromous Fish Conservation Act of 1965, as amended</i>	Authorizes the Secretaries of Interior and Commerce to enter into cooperative agreements with states and other non-federal interests for conservation, development, and enhancement of anadromous fish and contribute up to 50 percent as the federal share of the cost of carrying out such agreements. Reclamation construction programs for water resource projects needed solely for such fish are also authorized.
<i>Archaeological Resources Protection Act of 1979, as amended.</i>	This Act strengthens and expands the protective provisions of the Antiquities Act of 1906 regarding archaeological resources. It also revised the permitting process for archaeological research.
<i>Architectural Barriers Act of 1968</i>	Requires that buildings and facilities designed, constructed, or altered with federal funds, or leased by a federal agency, must comply with standards for physical accessibility.
<i>Bald and Golden Eagle Protection Act of 1940, as amended</i>	Prohibits the possession, sale or transport of any bald or golden eagle, alive or dead, or part, nest, or egg except as permitted by the Secretary of the Interior for scientific or exhibition purposes, or for the religious purposes of Indians.

STATUTE	DESCRIPTION
<i>Bankhead-Jones Farm Tenant Act of 1937</i>	Directs the Secretary of Agriculture to develop a program of land conservation and utilization in order to correct maladjustments in land use and thus assist in such things as control of soil erosion, reforestation, conservation of natural resources and protection of fish and wildlife. Some early refuges and hatcheries were established under authority of this Act.
<i>Cave Resources Protection Act of 1988</i>	Established requirements for the management and protection of caves and their resources on federal lands, including allowing the land managing agencies to withhold the location of caves from the public, and requiring permits for any removal or collecting activities in caves on federal lands.
<i>Clean Air Act of 1970</i>	Regulates air emissions from area, stationary, and mobile sources. This Act and its amendments charge federal land managers with direct responsibility to protect the "air quality and related values" of land under their control. These values include fish, wildlife, and their habitats.
<i>Clean Water Act of 1974, as amended</i>	This Act and its amendments have as its objective the restoration and maintenance of the chemical, physical, and biological integrity of the Nation's waters. Section 401 of the Act requires that federally permitted activities comply with the Clean Water Act standards, state water quality laws, and any other appropriate state laws. Section 404 charges the U.S. Army Corps of Engineers with regulating discharge of dredge or fill materials into waters of the United States, including wetlands.
<i>Coastal Barrier Resources Act of 1982 (CBRA)</i>	Identifies undeveloped coastal barriers along the Atlantic and Gulf Coasts and included them in the John H. Chafee Coastal Barrier Resources System (CBRS). The objectives of the act are to minimize loss of human life, reduce wasteful federal expenditures, and minimize the damage to natural resources by restricting most federal expenditures that encourage development within the CBRS.
<i>Coastal Barrier Improvement Act of 1990</i>	Reauthorized the Coastal Barrier Resources Act (CBRA), expanded the CBRS to include undeveloped coastal barriers along the Great Lakes and in the Caribbean, and established "Otherwise Protected Areas (OPAs)." The Service is responsible for maintaining official maps, consulting with federal agencies that propose spending federal funds within the CBRS and OPAs, and making recommendations to Congress about proposed boundary revisions.
<i>Coastal Wetlands Planning, Protection, and Restoration (1990)</i>	Authorizes the Director of the Fish and Wildlife Service to participate in the development of a Louisiana coastal wetlands restoration program, participate in the development and oversight of a coastal wetlands conservation program, and lead in the implementation and administration of a national coastal wetlands grant program.

STATUTE	DESCRIPTION
<i>Coastal Zone Management Act of 1972, as amended</i>	Established a voluntary national program within the Department of Commerce to encourage coastal states to develop and implement coastal zone management plans and requires that “any federal activity within or outside of the coastal zone that affects any land or water use or natural resource of the coastal zone” shall be “consistent to the maximum extent practicable with the enforceable policies” of a state’s coastal zone management plan. The law includes an Enhancement Grants Program for protecting, restoring, or enhancing existing coastal wetlands or creating new coastal wetlands. It also established the National Estuarine Research Reserve System, guidelines for estuarine research, and financial assistance for land acquisition.
<i>Emergency Wetlands Resources Act of 1986</i>	This Act authorized the purchase of wetlands from Land and Water Conservation Fund moneys, removing a prior prohibition on such acquisitions. The Act requires the Secretary to establish a National Wetlands Priority Conservation Plan, required the states to include wetlands in their Comprehensive Outdoor Recreation Plans, and transfers to the Migratory Bird Conservation Fund amounts equal to import duties on arms and ammunition. It also established entrance fees at national wildlife refuges.
<i>Endangered Species Act of 1973, as amended</i>	Provides for the conservation of threatened and endangered species of fish, wildlife, and plants by federal action and by encouraging the establishment of state programs. It provides for the determination and listing of threatened and endangered species and the designation of critical habitats. Section 7 requires refuge managers to perform internal consultation before initiating projects that affect or may affect endangered species.
<i>Environmental Education Act of 1990</i>	This Act established the Office of Environmental Education within the U.S. Environmental Protection Agency to develop and administer a federal environmental education program in consultation with other federal natural resource management agencies, including the Fish and Wildlife Service.
<i>Estuary Protection Act of 1968</i>	Authorized the Secretary of the Interior, in cooperation with other federal agencies and the states, to study and inventory estuaries of the United States, including land and water of the Great Lakes, and to determine whether such areas should be acquired for protection. The Secretary is also required to encourage state and local governments to consider the importance of estuaries in their planning activities relative to federal natural resource grants. In approving any state grants for acquisition of estuaries, the Secretary was required to establish conditions to ensure the permanent protection of estuaries.

STATUTE	DESCRIPTION
<i>Estuaries and Clean Waters Act of 2000</i>	This law creates a federal interagency council that includes the Director of the Fish and Wildlife Service, the Secretary of the Army for Civil Works, the Secretary of Agriculture, the Administrator of the Environmental Protection Agency and the Administrator for the National Oceanic and Atmospheric Administration. The council is charged with developing a national estuary habitat restoration strategy and providing grants to entities to restore and protect estuary habitat to promote the strategy.
<i>Food Security Act of 1985, as amended (Farm Bill)</i>	The Act contains several provisions that contribute to wetland conservation. The Swampbuster provisions state that farmers who convert wetlands for the purpose of planting after enactment of the law are ineligible for most farmer program subsidies. It also established the Wetland Reserve Program to restore and protect wetlands through easements and restoration of the functions and values of wetlands on such easement areas.
<i>Farmland Protection Policy Act of 1981, as amended</i>	The purpose of this law is to minimize the extent to which federal programs contribute to the unnecessary conversion of farmland to nonagricultural uses. Federal programs include construction projects and the management of federal lands.
<i>Federal Advisory Committee Act (1972), as amended</i>	Governs the establishment of and procedures for committees that provide advice to the federal government. Advisory committees may be established only if they will serve a necessary, nonduplicative function. Committees must be strictly advisory unless otherwise specified and meetings must be open to the public.
<i>Federal Coal Leasing Amendment Act of 1976</i>	Provided that nothing in the Mining Act, the Mineral Leasing Act, or the Mineral Leasing Act for Acquired Lands authorized mining coal on refuges.
<i>Federal-Aid Highways Act of 1968</i>	Established requirements for approval of federal highways through national wildlife refuges and other designated areas to preserve the natural beauty of such areas. The Secretary of Transportation is directed to consult with the Secretary of the Interior and other federal agencies before approving any program or project requiring the use of land under their jurisdiction.
<i>Federal Noxious Weed Act of 1990, as amended</i>	The Secretary of Agriculture was given the authority to designate plants as noxious weeds and to cooperate with other federal, State and local agencies, farmers' associations, and private individuals in measures to control, eradicate, prevent, or retard the spread of such weeds. The Act requires each Federal land-managing agency, including the Fish and Wildlife Service, to designate an office or person to coordinate a program to control such plants on the agency's land and implement cooperative agreements with the states, including integrated management systems to control undesirable plants.

STATUTE	DESCRIPTION
<i>Federal Lands Recreation Enhancement Act (REA)</i>	Limits fees to recreation sites that have a specified minimum level of development and meet specific criteria. Provides new public participation opportunities when agencies propose to establish new, or alter existing, recreation fees. For the BLM and the US Forest Service this includes providing Recreation Resource Advisory Committees with an opportunity to review and make recommendations on agency fee proposals. Authorizes a new interagency recreation pass – the “America the Beautiful – National Parks and Federal Recreational Lands Pass”.
<i>Fish and Wildlife Act of 1956</i>	Establishes a comprehensive national fish, shellfish, and wildlife resources policy with emphasis on the commercial fishing industry but also includes the inherent right of every citizen and resident to fish for pleasure, enjoyment, and betterment and to maintain and increase public opportunities for recreational use of fish and wildlife resources. Among other things, it authorizes the Secretary of the Interior to take such steps as may be required for the development, advancement, management, conservation, and protection of fish and wildlife resources including, but not limited to, research, development of existing facilities, and acquisition by purchase or exchange of land and water or interests therein.
<i>Fish and Wildlife Conservation Act of 1980, as amended</i>	Requires the Service to monitor non-gamebird species, identify species of management concern, and implement conservation measures to preclude the need for listing under the Endangered Species Act.
<i>Fish and Wildlife Coordination Act of 1958</i>	Promotes equal consideration and coordination of wildlife conservation with other water resource development programs by requiring consultation with the Fish and Wildlife Service and the state fish and wildlife agencies where the “waters of a stream or other body of water are proposed or authorized, permitted or licensed to be impounded, diverted...or otherwise controlled or modified” by any agency under federal permit or license.
<i>Improvement Act of 1978</i>	This act was passed to improve the administration of fish and wildlife programs and amends several earlier laws, including the Refuge Recreation Act, the National Wildlife Refuge System Administration Act, and the Fish and Wildlife Act of 1956. It authorizes the Secretary to accept gifts and bequests of real and personal property on behalf of the United States. It also authorizes the use of volunteers on Service projects and appropriations to carry out volunteer programs.
<i>Fishery (Magnuson) Conservation and Management Act of 1976</i>	Established Regional Fishery Management Councils comprised of federal and state officials, including the Fish and Wildlife Service. It provides for regulation of foreign fishing and vessel fishing permits.

STATUTE	DESCRIPTION
<i>Freedom of Information Act, 1966</i>	Requires all federal agencies to make available to the public for inspection and copying administrative staff manuals and staff instructions; official, published and unpublished policy statements; final orders deciding case adjudication; and other documents. Special exemptions have been reserved for nine categories of privileged material. The Act requires the party seeking the information to pay reasonable search and duplication costs.
<i>Geothermal Steam Act of 1970, as amended</i>	Authorizes and governs the lease of geothermal steam and related resources on public lands. Section 15 c of the Act prohibits issuing geothermal leases on virtually all Service-administrative lands.
<i>Lacey Act of 1900, as amended</i>	Originally designed to help states protect their native game animals and to safeguard U.S. crop production from harmful foreign species, this Act prohibits interstate and international transport and commerce of fish, wildlife or plants taken in violation of domestic or foreign laws. It regulates the introduction to America of foreign species.
<i>Land and Water Conservation Fund Act of 1948</i>	This Act provides funding through receipts from the sale of surplus federal land, appropriations from oil and gas receipts from the outer continental shelf, and other sources for land acquisition under several authorities. Appropriations from the fund may be used for matching grants to states for outdoor recreation projects and for land acquisition by various federal agencies, including the Fish and Wildlife Service.
<i>Marine Mammal Protection Act of 1972, as amended</i>	The 1972 Marine Mammal Protection Act established a federal responsibility to conserve marine mammals with management vested in the Department of the Interior for sea otter, walrus, polar bear, dugong, and manatee. The Department of Commerce is responsible for cetaceans and pinnipeds, other than the walrus. With certain specified exceptions, the Act establishes a moratorium on the taking and importation of marine mammals, as well as products taken from them.
<i>Migratory Bird Conservation Act of 1929</i>	Established a Migratory Bird Conservation Commission to approve areas recommended by the Secretary of the Interior for acquisition with Migratory Bird Conservation Funds. The role of the commission was expanded by the North American Wetland Conservation Act to include approving wetlands acquisition, restoration, and enhancement proposals recommended by the North American Wetlands Conservation Council.
<i>Migratory Bird Hunting and Conservation Stamp Act of 1934</i>	Also commonly referred to as the "Duck Stamp Act," requires waterfowl hunters 16 years of age or older to possess a valid federal hunting stamp. Receipts from the sale of the stamp are deposited into the Migratory Bird Conservation Fund for the acquisition of migratory bird refuges.

STATUTE	DESCRIPTION
<i>Migratory Bird Treaty Act of 1918, as amended</i>	This Act implements various treaties and conventions between the United States and Canada, Japan, Mexico, and the former Soviet Union for the protection of migratory birds. Except as allowed by special regulations, this Act makes it unlawful to pursue, hunt, kill, capture, possess, buy, sell, purchase, barter, export or import any migratory bird, part, nest, egg, or product.
<i>Mineral Leasing Act for Acquired Lands (1947), as amended</i>	Authorizes and governs mineral leasing on acquired public lands.
<i>Minerals Leasing Act of 1920, as amended</i>	Authorizes and governs leasing of public lands for development of deposits of coal, oil, gas, and other hydrocarbons; sulphur; phosphate; potassium; and sodium. Section 185 of this title contains provisions relating to granting rights-of-way over federal lands for pipelines.
<i>Mining Act of 1872, as amended</i>	Authorizes and governs prospecting and mining for the so-called "hardrock" minerals (i.e., gold and silver) on public lands.
<i>National and Community Service Act of 1990</i>	Authorizes several programs to engage citizens of the U.S. in full-and/or part-time projects designed to combat illiteracy and poverty, provide job skills, enhance educational skills, and fulfill environmental needs. Among other things, this law establishes the American Conservation and Youth Service Corps to engage young adults in approved human and natural resource projects, which will benefit the public or are carried out on federal or Indian lands.
<i>National Environmental Policy Act of 1969</i>	Requires analysis, public comment, and reporting for environmental impacts of federal actions. It stipulates the factors to be considered in environmental impact statements, and requires that federal agencies employ an interdisciplinary approach in related decision-making and develop means to ensure that unqualified environmental values are given appropriate consideration, along with economic and technical considerations.
<i>National Historic Preservation Act of 1966, as amended</i>	It establishes a National Register of Historic Places and a program of matching grants for preservation of significant historical features. Federal agencies are directed to take into account the effects of their actions on items or sites listed or eligible for listing in the National Register.
<i>National Trails System Act (1968), as amended</i>	Established the National Trails System to protect the recreational, scenic, and historic values of some important trails. National recreation trails may be established by the Secretaries of Interior or Agriculture on land wholly or partly within their jurisdiction, with the consent of the involved state(s), and other land managing agencies, if any. National scenic and national historic trails may only be designated by Congress. Several national trails cross units of the National Wildlife Refuge System.

STATUTE	DESCRIPTION
<i>National Wildlife Refuge System Administration Act of 1966</i>	Prior to 1966, there was no single federal law that governed the administration of the various national wildlife refuges that had been established. This Act defines the National Wildlife Refuge System and authorizes the Secretary of the Interior to permit any use of a refuge provided such use is compatible with the major purposes(s) for which the refuge was established.
<i>National Wildlife Refuge System Improvement Act of 1997</i>	This Act amends the National Wildlife Refuge System Administration Act of 1966. This Act defines the mission of the National Wildlife Refuge System, establishes the legitimacy and appropriateness of six priority wildlife-dependent public uses, establishes a formal process for determining compatible uses of Refuge System lands, identifies the Secretary of the Interior as responsible for managing and protecting the Refuge System, and requires the development of a comprehensive conservation plan for all refuges outside of Alaska.
<i>Native American Graves Protection and Repatriation Act of 1990</i>	Requires federal agencies and museums to inventory, determine ownership of, and repatriate certain cultural items and human remains under their control or possession. The Act also addresses the repatriation of cultural items inadvertently discovered by construction activities on lands managed by the agency.
<i>Neotropical Migratory Bird Conservation Act of 2000</i>	Establishes a matching grant program to fund projects that promote the conservation of neotropical migratory birds in the United States, Latin America, and the Caribbean.
<i>North American Wetlands Conservation Act of 1989</i>	Provides funding and administrative direction for implementation of the North American Waterfowl Management Plan and the Tripartite Agreement on wetlands between Canada, the United States, and Mexico. The North American Wetlands Conservation Council was created to recommend projects to be funded under the Act to the Migratory Bird Conservation Commission. Available funds may be expended for up to 50 percent of the United States' share cost of wetlands conservation projects in Canada, Mexico, or the United States (or 100 percent of the cost of projects on federal lands).
<i>Refuge Recreation Act of 1962, as amended</i>	This Act authorizes the Secretary of the Interior to administer refuges, hatcheries, and other conservation areas for recreational use, when such uses do not interfere with the area's primary purposes. It authorizes construction and maintenance of recreational facilities and the acquisition of land for incidental fish and wildlife-oriented recreational development or protection of natural resources. It also authorizes the charging of fees for public uses.

STATUTE	DESCRIPTION
<i>Partnerships for Wildlife Act of 1992</i>	Establishes a Wildlife Conservation and Appreciation Fund to receive appropriated funds and donations from the National Fish and Wildlife Foundation and other private sources to assist the state fish and game agencies in carrying out their responsibilities for conservation of non-game species. The funding formula is no more than 1/3 federal funds, at least 1/3 foundation funds, and at least 1/3 state funds.
<i>Refuge Revenue Sharing Act of 1935, as amended</i>	Provided for payments to counties in lieu of taxes from areas administered by the Fish and Wildlife Service. Counties are required to pass payments along to other units of local government within the county, which suffer losses in tax revenues due to the establishment of Service areas.
<i>Rehabilitation Act of 1973</i>	Requires nondiscrimination in the employment practices of federal agencies of the executive branch and contractors. It also requires all federally assisted programs, services, and activities to be available to people with disabilities.
<i>Rivers and Harbors Appropriations Act of 1899, as amended</i>	Requires the authorization by the U.S. Army Corps of Engineers prior to any work in, on, over, or under a navigable water of the United States. The Fish and Wildlife Coordination Act provides authority for the Service to review and comment on the effects on fish and wildlife activities proposed to be undertaken or permitted by the Corps of Engineers. Service concerns include contaminated sediments associated with dredge or fill projects in navigable waters.
<i>Sikes Act (1960), as amended</i>	Provides for the cooperation by the Departments of Interior and Defense with state agencies in planning, development, and maintenance of fish and wildlife resources and outdoor recreation facilities on military reservations throughout the United States. It requires the Secretary of each military department to use trained professionals to manage the wildlife and fishery resource under his jurisdiction, and requires that federal and state fish and wildlife agencies be given priority in management of fish and wildlife activities on military reservations.
<i>Transfer of Certain Real Property for Wildlife Conservation Purposes Act of 1948</i>	This Act provides that upon determination by the Administrator of the General Services Administration, real property no longer needed by a federal agency can be transferred, without reimbursement, to the Secretary of the Interior if the land has particular value for migratory birds, or to a state agency for other wildlife conservation purposes.
<i>Transportation Equity Act for the 21st Century (1998)</i>	Established the Refuge Roads Program, requires transportation planning that includes public involvement, and provides funding for approved public use roads and trails and associated parking lots, comfort stations, and bicycle/pedestrian facilities.

---

STATUTE	DESCRIPTION
<i>Uniform Relocation and Assistance and Real Property Acquisition Policies Act (1970), as amended</i>	Provides for uniform and equitable treatment of persons who sell their homes, businesses, or farms to the Service. The Act requires that any purchase offer be no less than the fair market value of the property.
<i>Water Resources Planning Act of 1965</i>	Established Water Resources Council to be composed of Cabinet representatives including the Secretary of the Interior. The Council reviews river basin plans with respect to agricultural, urban, energy, industrial, recreational and fish and wildlife needs. The act also established a grant program to assist States in participating in the development of related comprehensive water and land use plans.
<i>Wild and Scenic Rivers Act of 1968, as amended</i>	This Act selects certain rivers of the nation possessing remarkable scenic, recreational, geologic, fish and wildlife, historic, cultural, or other similar values; preserves them in a free-flowing condition; and protects their local environments.
<i>Wilderness Act of 1964, as amended</i>	This Act directs the Secretary of the Interior to review every roadless area of 5,000 acres or more and every roadless island regardless of size within the National Wildlife Refuge System and to recommend suitability of each such area. The Act permits certain activities within designated wilderness areas that do not alter natural processes. Wilderness values are preserved through a "minimum tool" management approach, which requires refuge managers to use the least intrusive methods, equipment, and facilities necessary for administering the areas.
<i>Youth Conservation Corps Act of 1970</i>	Established a permanent Youth Conservation Corps (YCC) program within the Departments of Interior and Agriculture. Within the Service, YCC participants perform many tasks on refuges, fish hatcheries, and research stations.

EXECUTIVE ORDERS	DESCRIPTIONS
<i>EO 11593, Protection and Enhancement of the Cultural Environment (1971)</i>	States that if the Service proposes any development activities that may affect the archaeological or historic sites, the Service will consult with Federal and State Historic Preservation Officers to comply with Section 106 of the National Historic Preservation Act of 1966, as amended.
<i>EO 11644, Use of Off-road Vehicles on Public Land (1972)</i>	Established policies and procedures to ensure that the use of off-road vehicles on public lands will be controlled and directed so as to protect the resources of those lands, to promote the safety of all users of those lands, and to minimize conflicts among the various uses of those lands.
<i>EO 11988, Floodplain Management (1977)</i>	The purpose of this Executive Order is to prevent federal agencies from contributing to the “adverse impacts associated with occupancy and modification of floodplains” and the “direct or indirect support of floodplain development.” In the course of fulfilling their respective authorities, federal agencies “shall take action to reduce the risk of flood loss, to minimize the impact of floods on human safety, health and welfare, and to restore and preserve the natural and beneficial values served by floodplains.”
<i>EO 11989 (1977), Amends Section 2 of EO 11644</i>	Directs agencies to close areas negatively impacted by off-road vehicles.
<i>EO 11990, Protection of Wetlands (1977)</i>	Federal agencies are directed to provide leadership and take action to minimize the destruction, loss of degradation of wetlands, and to preserve and enhance the natural and beneficial values of wetlands.
<i>EO 12372, Intergovernmental Review of Federal Programs (1982)</i>	Seeks to foster intergovernmental partnerships by requiring federal agencies to use the state process to determine and address concerns of state and local elected officials with proposed federal assistance and development programs.
<i>EO 12898, Environmental Justice (1994)</i>	Requires federal agencies to identify and address disproportionately high and adverse effects of its programs, policies, and activities on minority and low-income populations.

EXECUTIVE ORDERS	DESCRIPTIONS
<p><i>EO 12906, Coordinating Geographical Data Acquisition and Access (1994), Amended by EO 13286 (2003). Amendment of EOs and other actions in connection with transfer of certain functions to Secretary of DHS.</i></p>	<p>Recommended that the executive branch develop, in cooperation with state, local, and tribal governments, and the private sector, a coordinated National Spatial Data Infrastructure to support public and private sector applications of geospatial data. Of particular importance to comprehensive conservation planning is the National Vegetation Classification System (NVCS), which is the adopted standard for vegetation mapping. Using NVCS facilitates the compilation of regional and national summaries, which in turn, can provide an ecosystem context for individual refuges.</p>
<p><i>EO 12962, Recreational Fisheries (1995)</i></p>	<p>Federal agencies are directed to improve the quantity, function, sustainable productivity, and distribution of U.S. aquatic resources for increased recreational fishing opportunities in cooperation with states and tribes.</p>
<p><i>EO 13007, Native American Religious Practices (1996)</i></p>	<p>Provides for access to, and ceremonial use of, Indian sacred sites on federal lands used by Indian religious practitioners and direction to avoid adversely affecting the physical integrity of such sites.</p>
<p><i>EO 13061, Federal Support of Community Efforts Along American Heritage Rivers (1997)</i></p>	<p>Established the American Heritage Rivers initiative for the purpose of natural resource and environmental protection, economic revitalization, and historic and cultural preservation. The Act directs Federal agencies to preserve, protect, and restore rivers and their associated resources important to our history, culture, and natural heritage.</p>
<p><i>EO 13084, Consultation and Coordination With Indian Tribal Governments (2000)</i></p>	<p>Provides a mechanism for establishing regular and meaningful consultation and collaboration with tribal officials in the development of federal policies that have tribal implications.</p>
<p><i>EO 13112, Invasive Species (1999)</i></p>	<p>Federal agencies are directed to prevent the introduction of invasive species, detect and respond rapidly to and control populations of such species in a cost effective and environmentally sound manner, accurately monitor invasive species, provide for restoration of native species and habitat conditions, conduct research to prevent introductions and to control invasive species, and promote public education on invasive species and the means to address them. This EO replaces and rescinds EO 11987, Exotic Organisms (1977).</p>

---

EXECUTIVE ORDERS	DESCRIPTIONS
<i>EO 13186, Responsibilities of Federal Agencies to Protect Migratory Birds.</i> (2001)	Instructs federal agencies to conserve migratory birds by several means, including the incorporation of strategies and recommendations found in Partners in Flight Bird Conservation plans, the North American Waterfowl Plan, the North American Waterbird Conservation Plan, and the United States Shorebird Conservation Plan, into agency management plans and guidance documents.

---

## *Appendix D. Public Involvement*

### **SUMMARY OF PUBLIC SCOPING COMMENTS**

Please refer to Section A, Chapter III, Plan Development, for a summary of the issues, concerns, and opportunities that were identified by the public during public scoping.

### **SUMMARY OF PUBLIC COMMENTS ON THE DRAFT CCP/EA AND SERVICE RESPONSES**

This appendix summarizes all comments that were received on the Draft Comprehensive Conservation Plan and Environmental Assessment for Sam D. Hamilton Noxubee National Wildlife Refuge. Public comments on this draft document were accepted from August 28 to October 27, 2014.

A total of 37 individuals submitted comments on the Draft Comprehensive Conservation Plan and Environmental Assessment, either in writing or at public forums held on September 29-Oct.1, 2014. More than one individual represented some agencies or organizations.

### **PUBLIC FORUMS**

During the August 28-October 27, 2014, public review period, the refuge and planning staffs hosted three public forums, one on September 29 at the Tully Auditorium at Mississippi State University in Starkville, one on September 30 at the Noxubee County Civic Center in Macon, and one on October 1 at the Lake Tiak O'Khata conference Center in Louisville. Each forum began at 5:00 p.m. and concluded at 7:00 p.m. The forums started as. A 20-minute formal presentation on the draft plan was then given, followed by an open house with the refuge staff available to discuss the draft plan and refuge operations with the attendees. A total of four individuals offered comments during these three public forums.

### **COMMENT MEDIA**

The types of media used to deliver the comments received by the refuge and planning staffs are categorized as follows: faxed, 1; written letter, 6; and e-mail, 27.

### **GEOGRAPHIC ORIGIN OF RESPONDENTS**

The geographic origins of the individual respondents who submitted comments are Tennessee, Mississippi, Florida, California, and Washington D.C.

### **SUMMARY OF CONCERNS AND THE SERVICE'S RESPONSES**

The public comments received address the following concerns. The Fish and Wildlife Service's responses to each concern are also summarized.

#### ***GENERAL***

**Comment:** Vision statement should be reworded as suggested.

---

**Service Response:** Edited vision statement to address use of confusing terms - Sam D. Hamilton Noxubee National Wildlife Refuge is a key puzzle piece within an interconnecting landscape otherwise dominated by small cities, rural communities, and lands devoted to agriculture and commercial forestry. The refuge includes pine forests, bottomland and upland hardwood forests, cypress swamps, and wetlands surrounding the historic Noxubee River whose channel and floodwaters support migratory bird species and a host of native flora and fauna. The refuge promises to conserve and manage its natural diversity by restoring and protecting historic habitats and wildlife while working with partners, listening to the American public, and promoting awareness. In the future, habitat management and public use program objectives will no longer be viewed through a lens of simply the next 15 years, but as one step in a process covering the next 100 years. Management of the refuge's habitats will be designed to support resources of concern and species of complimentary need. Refuge management will recognize the position of the refuge within the surrounding landscape and target those unique ecological roles it can fulfill within that landscape. New programs will be developed to provide users with a better understanding and appreciation of natural and cultural resources.

**Comment:** Use larger maps within document

**Service Response:** Comment noted. The maps will be enlarged for management units.

**Comment:** We all agree that it is extremely well written and very thorough. None of us could find anything to comment on or add to. We feel that it is an excellent management plan and we support the plan all the way.

**Service Response:** Comment Noted.

**Comment:** What roads will provide access to the refuge and which will be closed in the CCP?

**Service Response:** Reference Draft CCP Chapter 5, Project 11, page 115.

**Comment:** Although the RCW was listed in the Federal Register as endangered in 1970, it was originally listed as endangered by the Department of the Interior in 1968 (Jackson 2004, U.S. Department of the Interior 1968).

**Service Response:** Comment noted.

#### *WILDLIFE AND HABITAT MANAGEMENT*

**Comment:** 1) Bottomland hardwoods need greater protection and managed so not to produce edge; 2) no treatments should be completed to encourage shade intolerant species; 3) treat bottomland hardwood areas using single tree selection only; 4) leave bottomland hardwood forest in a natural state.

---

**Service Response:** Loss of connectivity between bottomland hardwood forest sites (e.g., forest fragmentation) is listed as one of the greatest ecological threats and problems (Draft CCP/EA page 23). Current bottomland hardwood forests are underrepresented when compared to historic habitat conditions by approximately 3,727 acres (Draft CCP/EA page 32). Four green-tree reservoirs (GTR) were created within the bottomland hardwood forest and have been impacted to varying degrees by management. One GTR is now more grassland than forest, one dominated by shade and water tolerant plant species and two still representing the native characteristics of bottomland hardwood forest. Decline in habitat quality of bottomland hardwood forest was listed as a priority issue (Draft CCP/EA page 64). As discussed in Habitat Management (Draft CCP/EA page 66) disturbance of overstory trees is necessary to protect and promote forest health. Many species of trees and vegetation that are important representatives of healthy bottomland hardwood forest are shade intolerant species, including oaks. Providing light gaps are extremely important for promoting regeneration of shade intolerant species. The issue of fragmentation is additionally discussed in Sub-Goal A.3 - Forest Breeding Birds. The Lower Mississippi Valley Joint Venture produced recommendations for enhancing wildlife habitat within bottomland hardwood habitats (LMVJV Restoration, Management, and Monitoring of Forest Resources in the Mississippi Alluvial Valley: Recommendations for Enhancing Wildlife Habitat 2007). Conservation of priority bird species is of focus within these recommendation and the refuge plans to follow these recommendations in the management of the refuge's bottomland hardwood forest. Ongoing monitoring of species of complimentary need will to be conducted and will direct adaptive management. The 1,200-acre wilderness area will be an area of reference with limited management to also direct adaptive management. Adaptive management as defined by the Department of Interior in Technical Guide (Williams et al. 2009) and within an additional Application Guide (Williams et al. 2012).

**Comment:** We support managing hardwood bottoms where it is necessary to promote red oak species but only by using individual tree removal and we are opposed to group selection which may create openings up to 2.5 acres and patch cuts which are small clearcuts of 2.5 to 7acres

**Service Response:** See earlier comment about light gaps

**Comment:** Another concern I have is the proposed cuts throughout the bottomland hardwood forest(s) to create canopy openings (i.e., "edge"). These canopy openings are unnecessary for the species they are targeted to benefit. Enough edge on (and off!) the refuge exists already. For example, Yellow Warblers (a transient spring/fall migrant) can and do forage in stands of willow, cypress, river birch, etc. which occur around the large lakes at Noxubee refuge, as well as sites off the refuge. No new habitat for Brown-headed Cowbirds (a brood parasite) need be created.

**Service Response:** Comment noted. See earlier response to light gaps.

---

**Comment:** Though I somewhat understand the balance the draft plan is proposing in Alternative C, when I read over the Beneficial and Adverse effects comparison (Draft CCP/EA pages 185-200) under some of the sections, it raises some concern about the possibility that adverse effects might outweigh beneficial effects, especially if management to achieve the anticipated results are not spread over many years. For example, under the heading of "Bottomland Hardwoods," if all of the "increased active forest management" is done in all bottomland hardwood areas near the same time, the adverse effect would probably outweigh the beneficial effect for a very long time. It seems there should be many years between projects in different areas to gradually make the changes so as to impact current wildlife less. I would hope the plan will be implemented in such a way to impact current wildlife as little as possible. I would not like to see large "patch" cuts in these bottomland hardwood areas, since this type of habitat is not common in areas outside of the refuge.

**Service Response:** Management on the refuge is conducted for the benefit of wildlife. The action of management is not the goal; it is the response to the action by wildlife. Refuge staff must practice adaptive management and practice a willingness to adjust to the reactions of both the habitat and the needs of the wildlife and for this reason it is important to monitor the wildlife response. Each management unit discussed within the HMP includes a section titled, Adaptive Management Monitoring Element. Treatments and retreatments will be informed by the information obtained through monitoring.

**Comment:** 1) Existing grassy fields should be maintained for butterflies and grassland birds. 2) All old fields should not be converted from grassland, old field habitat; 3) Maintain Green-tree Reservoir-3 as grassland.

**Service Response:** The majority of the existing grassy fields located on the refuge exist within areas occupied by the federal listed red-cockaded woodpecker. These birds depend on mature pine forest for meeting habitat requirements. The number of pine acres available to an individual cluster of birds is typically the largest limiting factor in managing for the bird's long-term survival. If forested in pine, the majority of the existing fields will provide much needed habitat for this priority bird species. Management of areas for Good Quality Foraging Habitat for red-cockaded woodpeckers promotes increased production of herbaceous plants within the understory and for this reason; grassland wildlife species should also benefit reducing the impacts of the loss of any grassland fields. The refuge does plan to maintain fields (reference in Draft CCP/EA and HMP) for grassland birds and insects. Green-tree Reservoir-3, however, is bottomland hardwood forest that has been lost due to continual flooding and has subsequently been managed as a moist-soil wetland. This field is not needed to meet waterfowl objectives and though used by wading birds will be managed for its historical habitat in support of the 1997 Refuge Improvement Act.

**Comment:** 1) Why is there no plan to expand number of red-cockaded woodpeckers; 2) manage RCW partitions for acres less than 300 acres of contiguous pine; how will the refuge reach recovery of the species; the reduction in the refuge RCW population size objective from 88 clusters in the previous plan to 27 clusters is arbitrary and capricious, and the objective to establish and sustain GQFH is an inappropriate excuse to reduce the population size objective and to destroy and abandon habitat actually used.

---

**Service Response:** These comments and our response concern several interrelated factors for the process of revising the Refuge RCW population size objective and the associated management to restore and sustain habitat. The population size objective in the draft CCP/HMP was 38 active clusters over the life span of the plan. In response to public comment, we conducted additional analysis to examining the long-term potential and included both Management Unit 16 and existing active clusters which led to a new adjusted population size objective of 49 RCW clusters. Figure 13 was of the CCP was updated to show this new spatial analysis.

Refuge management complies with a variety of acts passed by Congress. For management of red-cockaded woodpecker, the Endangered Species Act of 1973, Improvement Act of 1997 along with several other applicable acts. The Recovery Plan for the Red-cockaded Woodpecker (2003) was developed to guide the steps necessary for the species to no longer be endangered or threatened with extinction. At the time of the Recovery Plan's development, Noxubee NWR staff estimated the refuge could support 88 RCW clusters. This number was developed by dividing 22,000 acres (the estimated total cumulative number of pine acres on the refuge) by 250 acres (the number of acres assigned to an individual cluster and foraging partition) (see page 131 of the Draft CCP/EA). The refuge objective of 88 RCW groups was not spatially explicit.

The analysis completed as part of the current CCP process is different from the original methodology associated with the Recovery Plan in that the current CCP considered the spatial location of the sustainable pine acres with other new information to more specifically address two key limiting factors. The first factor, there is a need to sustain RCW habitat by establishing young pine as future replacement for older pine before these older pine stands naturally senesce and die. This problem arises because of the current age-class distribution of pine stands. For example, 80% of the pine stand acreage (5,267 acres) within 30 active RCW partitions on the refuge in 2013 was 61 to 110 years old and most is 61 to 70 years old. There are only approximate 1,333 acres of future potential GQFH in stands 30 to 60 years of age.

If these loblolly pine stands senesce with substantial pine mortality at 120 years of age, then 60 years from now (2073) there will be a substantial loss of suitable and potentially suitable foraging habitat. A substantial future RCW population decline also would be expected concurrent with this future habitat loss. For example, only about 1,553 acres of pine stands 30 years of age or older would be available as suitable or potentially suitable foraging habitat in year 2073, compared to the current 6,600 acres available. Even if loblolly pine stands persist to 140 or more years of age before senescence, the same future age-class trend will occur due to an inadequate acreage of younger pine stands to replace older stands for sustained habitat. Loblolly would be expected to naturally regenerate within open areas in senescing stands, but the forest age-class at that future time would be dominated by young pine stands that fail to provide suitable foraging habitat. Thus, there is a need to begin to regenerate older pine stands to sustain habitat.

---

A second critical and related factor is the need to allocate manageable pine stands with a sufficient acreage to sustain foraging habitat in each RCW partition while increasing the acreage of younger non-foraging pine to replace older pine in the future. Harvesting older pine in suitable and potentially suitable foraging habitat to produce younger age classes will temporarily reduce the amount and quality of foraging habitat. Young pine stands do not provide sufficient foraging habitat until about 30 years of age when pine has grown to an average of 10" dbh providing at least 40 square feet per acre, along with other criteria of suitable foraging habitat. Based on the best available science and data on age-class structure and distribution, we estimated each individual RCW partition would need about 300 acres of pine to increase management flexibility to restore and sustain 120 acres of GQFH where possible for each RCW cluster and partition during this future period of regeneration with younger pine stands.

In response to public comment, we completed another spatially explicit analysis of the location of manageable pine stands relative to existing active RCW clusters and partitions with future RCW recruitment clusters and partitions. All pine acres are not located in one location and many of these acres are interspersed with other non-pine dominated habitat types. Upon reallocating habitat with an objective of 300 acres for each partition, the revised RCW population objective has been increased from the 38 clusters in the draft CCP/HMP to 49 clusters and partitions. A new figure (Figure 13) was added to the CCP showing the location of these 49 partitions. Attempting to establish more recruitment clusters and partitions of smaller size into remaining areas of contiguous or nearly contiguous pine would reduce the acreage of pine in partitions and the ability to sustain future foraging habitat and the population. The Environmental Assessment analyzed effects on both 88 and 38 potential clusters so this new goal number would be of beneficial impact on the refuge. The management objective is to restore and sustain 120 acres of manageable pine as GQFH to the maximum extent possible for each RCW group. The population size objective, although appearing reduced, is the outcome of the new spatially explicit analysis on management requirements to sustain pine habitat that is limited by the current pine age-class distribution while restoring habitat toward GQFH. The GQFH objective, as described in the 2003 Recovery Plan, is intended to enhance RCW group size and reproductive success. All currently active clusters regardless of their partition acreage will continue to be managed to improve and sustain habitat. Of these 29 active clusters, the pine acreage in partitions ranges from 22 to 429 acres, with an average of 211 acres. Twenty-three partitions have 300 acres or less of manageable pine stands; twenty-one have less than 250 acres. There is a limited ability to establish and sustain 120 acres of GQFH in most of these active RCW partitions due to the dominance of older pine age-classes and the need to establish younger pine for sustainable long-term habitat. Of the overall population size objective of 49 RCW clusters, 22 active clusters have less than 300 acres of manageable pine stands. Thus, a substantial part of the population objective will consist of management in less than 300-acre partitions.

Achieving the revised Refuge RCW population size objective will require increasing the size of the current population, with 29 active clusters, to 49 active clusters. Management methods to increase the population will comply with guidelines in the RCW Recovery Plan by establishing recruitment clusters with suitable cavities and suitable foraging habitat at spatially suitable locations near active clusters to induce the formation of new RCW groups.

**Comment:** GQFH standards for a loblolly pine forest at the Refuge need to be developed. RCWs have always lived in a mixed pine/hardwood habitat at the Refuge. Recent studies and the best available science recognize that RCWs inhabit and flourish in a broader range of habitat conditions than those prescribed by GQFH.

---

**Service Response:** The 2003 RCW Recovery Plan criteria for GQFH includes a provision allowing up to 29 percent of all overstory canopy trees to consist of hardwoods in loblolly pine dominated forest. The recent study by McKellar et al.<sup>1</sup> evaluated how variation in the attributes of GQFH affected RCW fitness (e.g. RCW group size and fledgling production). Results of the recent study by McKellar et al. are not directly applicable or sufficient at this time, to develop a modified set of GQFH criteria specific to the loblolly pine and loblolly-hardwood forests of the Refuge. These results do not indicate that GQFH criteria as applied to loblolly pine forests at the Refuge should be abandoned.

The nature of the analysis by McKellar et al. does not mean that management to reduce small pine stems and increase herbaceous plant cover at the site-specific threshold values identified at Fort Jackson will produce the same corresponding average increase in fledgling production at any or all other sites. The regression tree analysis method used by McKellar et al. was a multivariate statistical procedure where a significant threshold effect of the value of a particular GQFH attribute on RCW fitness also is affected by the values of all other site specific habitat parameters. Thus, threshold habitat values when identified at a particular Army installation also were a function of the nature of site specific current habitat conditions that were variable among Army installations due to historical forest conditions, management, and other factors.

The recovery objective of habitat management toward and to fulfill GQFH is to enhance RCW fitness and reduce home range size. By increasing habitat quality, RCW home range size will be reduced (e.g. Convery 2002)<sup>2</sup> and the population size capacity (e.g. number of RCW groups) on a management property can be increased. With sufficient future data, the development of any modified GQFH objective at the Refuge wouldn't necessarily reduce the objective to restore and sustain 120 acres of such habitat in each RCW partition. As previously described, a significant factor limiting the sustained future RCW population size at the Refuge is the disparity in loblolly pine age classes and the need to establish younger age classes to grow and provide suitable habitat as replacement for older pine prior to natural senescence. This required an allocation of 300 acres of pine habitat in future RCW recruitment partitions to sustain habitat while managing to reduce home range size and maximize population size capacity.

**Comment:** 1) What is meant by historic habitat conditions; 2) should not manage for historic conditions; 3) Managing for historic conditions restrict RCW growth.

---

**Service Response:** The Improvement Act of 1997 and policy 601 FW 3 are directives for the refuge to be managed for historic conditions. Historic habitat conditions, or historic conditions, is defined under policy 601 FW 3 as “composition, structure, and functioning of ecosystems resulting from natural processes that we believe, based on sound professional judgment, were present prior to substantial human related changes to the landscape.” The CCP references the LANDFIRE (2008) model as the best available information for determining historic conditions on the refuge as of 1830. Fotinos and Ertel (2013) used GLO data collected locally to verify the validity of the model and at this time LANDFIRE is the best available science.

LANDFIRE is a national project by the U.S. Department of Agriculture Forest Service and U.S. Department of Interior, with other agencies such as The Nature Conservancy, to provide a nationally consistent set of comprehensive data and geospatial products to support wildland and prescribed fire management. The comprehensive process and methods of developing LANDFIRE products has been described by Rollins (2009)<sup>3</sup> and Keane et al. (2006) and references therein. The biophysical setting (BpS) is a LANDFIRE product describing and mapping “the vegetation that may have been dominant on the landscape before Euro-American settlement based on both the current biophysical environment and an approximation of the disturbance regime” (Rollins 2009, <http://www.landfire.gov/vegetation.php>). Each BpS map unit represents the vegetation type from NatureServe’s Ecological Systems classification, which on the Refuge includes the East Gulf Coastal Plain Southern Loblolly-Hardwood Flatwoods, East Gulf Coastal Plain Interior Shortleaf Pine-Oak Forest, East Gulf Coastal Plain Northern Dry Upland Hardwood Forest, Gulf and Atlantic Coastal Plain Small Stream Riparian Systems, and Gulf and Atlantic Coastal Plain Swamp Systems. BpS map units were derived in LANDFIRE from potential vegetation types, known as environmental site potential (ESP), where ESP units are the vegetation that could be supported at a given site in response to climate, soils, topography and other factors at late seral stages in the absence of a natural fire regime or other natural disturbance. ESP units were modified to produce BpS units by modeling vegetation development and dynamics in response to a natural fire regime, based on regional workshops with ecologists held by The Nature Conservancy, a review of existing vegetation and fire ecology literature, and the biophysical setting.

---

The revised RCW population size objective was based on a spatially explicit analysis of the location of all current active clusters and placement of future recruitment clusters while allocating where possible 300 acres of manageable pine habitat in each partition. For the purposes of RCW habitat management, this is the habitat represented by the historic pine condition. It is considered manageable and the most compatible objective because existing pine and pine-hardwood stands at sites that were not historic pine or pine-hardwood are not likely to be sustained as pine-dominated stands for long-term periods with prescribed fire. Historic conditions with off-site pine are hardwood dominated and associated with the Gulf and Atlantic Coastal Plain Small Stream Riparian Systems and Gulf and Atlantic Coastal Plain Swamp Systems. These systems on the Refuge occur on periodically wet and partially hydric to hydric soils where fuel moisture conditions frequently are poor to sustain effective prescribed surface fires to control fire-intolerant hardwoods. However, the occurrence of pine and pine-hardwood stands within any of the currently active RCW partitions, regardless of historic condition, will continue to be managed with prescribed fire as frequently as possible. Such stands or areas will not be reverted by management using timber harvests or other measures to hardwood dominated stands. Loblolly pine stands in historic small stream riparian and swamp systems, particularly north of Hwy 25; reflect a historical legacy of forest clearing and disturbance by farming, with subsequent succession to loblolly pine in response to tree planting and early-phase natural forest succession of open fields.

**Comment:** The 2003 RCW Recovery Plan lists the Refuge population size objective as 88 active clusters. The FWS has ignored the best science available in the Recovery Plan by reducing the Refuge RCW population objective, which is a violation of the ESA. The Refuge population should be considered a core recovery population instead of significant support population. The EA is insufficient and an EIS is required due to the abandonment of the Recovery Plan.

**Service Response:** The Refuge population size objective listed in the 2003 RCW Recovery Plan (Table 9, page 161) as 88 active clusters was established based on non-spatially explicit information provided by Refuge staff. This coarse estimate was based on the acreage of pine and pine-hardwoods to provide at least 250 acres for each possible cluster. The current revised Refuge population size objective is based on a more thorough and spatially explicit analysis of the acreage of manageable pine stands for designated RCW clusters and partitions. Also, the reallocated acreage was increased, particularly in future recruitment clusters, to sustain foraging habitat during future intervals when older pine stands are regenerated to increase younger age-classes for future replacement of older pine stands. The current 2003 RCW Recovery Plan does not designate SDH Noxubee's refuge population as a primary core, secondary core, or essential support population. As a significant support population the population functions in various supporting roles to the designated primary core, secondary core, and essential support populations during recovery. Altering the Refuge RCW population objective in response to new analysis and information does not alter the Recovery Plan objectives or criteria for downlisting the species to threatened and delisting, which depends on the status of designated primary core, secondary core, and essential support populations. Changing the designation of this population to a primary core or secondary core recovery population is not within the scope or authority of the Refuge. Revising the Refuge RCW population size objective is not a violation of the ESA. The Recovery Plan does not impose a Refuge RCW population size objective representing a regulatory requirement under the ESA. The Recovery Plan population size objective as derived from an earlier Refuge objective was not arbitrarily rejected. Upon reanalysis, the earlier population size objective and as included in the Recovery Plan was found to have been overestimated and unsustainable.

---

NEPA requires that decisions be made with public involvement in a transparent way and provides us three different venues through which we can make those decisions: categorical exclusion from further NEPA documentation with an Environmental Action Statement, environmental assessment and Finding of No Significant Impact where impacts are determined to not be significant, or an environmental impact statement and a record of decision to analyze significant impacts. We believe we have fully complied with NEPA and considered a reasonable range of alternatives in accordance to FWS Planning and CCP Policies [e.g. 602 FW 1 and 602 FW 3].

**Comment:** 1) Requesting literature citation regarding maximum stands age for loblolly pine; 2) How do natural factors influence longevity of loblolly pine stands; 3) Managing for timber maximization and a 100-year pine rotation in a fully regulated forest for RCWs violates the ESA and Improvement Act; 4) Why a 100-year rotation age is used instead of 120-years?

**Service Response:** We have found there is a general lack of information concerning the maximum age to which a loblolly stand or forest such as that found on the refuge can be expected to survive at level to which the stand is able to support roosting and foraging needs of the red-cockaded woodpecker. For this reason, no literature citation is directly available.

---

Research has shown that with increasing age loblolly trees decline through increasing limitation of stomatal conductance. It is hypothesized that global climate changes that affect photosynthesis may have larger negative influence on future productivity of forest (Drake et al. 2010). Site characteristics can greatly influence maximum age of trees (Houle and Delwaide 2009). No published literature is available for determining maximum stand age for even-aged loblolly pine at senescence in central Mississippi or elsewhere in the RCW range. How long a stand will last beyond 100 years is unknown. In central Mississippi, Jones (1971)<sup>4</sup> briefly described a virgin loblolly pine stand in Bienville National Forest where the largest pine was about 180 years old, although the actual age-structure of the stand was not assessed. Bragg et al. (2008) concluded there was no highly reliable information on the age-structure of pre-settlement loblolly and shortleaf pine in similar flatwoods of south-central Arkansas, although age cores from pine stumps in the Levi Wilcoxon Demonstration Forest indicated a range of age from 80 to as old 300 years in the uneven-aged stand. Bragg (2002) also considered uneven-age attributes of old-growth loblolly pine as a reference condition in south-central Arkansas, where historical information from Chapman (1913) indicated loblolly and shortleaf pine inventoried near Crossett, AR rarely exceeded 150 years old, and the loblolly pine on the proposed Reynolds Research Natural Area on the U.S. Forest Service Crossett Experimental Forest was no older than 150 years (Shelton and Cain 1999). Heitzman (2004) describes what is called the Lost 40, an uneven-aged hardwood-pine stand located in southern Arkansas. Individual loblolly pines within this stand were described as being especially impressive in size and reaching a maximum tree estimated age of 143 years. The overall forest characteristics within the Lost 40 stand provides a glimpse at one possible outcome.

Maximum age for an individual tree is not meant to represent the maximum age to which stands of loblolly trees can survive; maximum stand age is lower. Our use of silvicultural terminology for even-aged pine management was not intended and does not in fact represent an objective to generate or maximize timber revenue. Refuge RCW Forest management goals are to establish sustainable foraging and cluster habitat including young pine to grow and mature as replacement for old pine. As previously described, there is an inadequate source of younger pine on the Refuge to replace the predominant and older age of most pine stands on the Refuge to sustain RCW foraging habitat. We hope these stands will survive and continue to provide RCW habitat at 120 or more years of age. We do not intend to harvest and regenerate any or every pine stand at 100 years of age. Older pine stands will be harvested and regenerated to establish younger stands as needed at sites and RCW partitions where the current age-class structure is inadequate to sustain long-term habitat. Given the uncertainty on the approximate future age at which these pine stands will senesce and decline, we used a 100-year rotation with a modified even-aged management and an irregular shelterwood as a minimum method to estimate the acreage of habitat within partitions to sustain 120 acres of GQFH for RCWs.

---

The proposed methods to manage and sustain forest for RCWs, as described in the HMP, include pre-commercial thinning, thinning, group selection, patch cuts, seed tree harvests, shelterwood harvests, and irregular shelterwood harvests. Where older stands are harvested and regenerated within RCW partitions to sustain habitat using an irregular shelterwood, for example, the method complies with silvicultural guidelines of the 2003 RCW Recovery Plan. By this method, an irregular shelterwood harvest for regeneration is two-aged management, although it is still considered a form of even-aged management, by not harvesting the shelterwood trees that will retain older and large pine greater than 10" dbh with at least 40 ft<sup>2</sup>/acre. One commenter stated that the proposed even-aged methods were not consistent with the Recovery Plan and violated the ESA. The Recovery Plan reference (page 100) concerned the application of strict even-aged methods and concluded that "[c]learcutting, standard seed tree, and standard shelterwood methods are not generally compatible with management to recover red-cockaded woodpeckers, except when used to restore native, site-appropriate pines." The Refuge does not propose and will not use strict even-aged forest management methods to restore and sustain habitat for RCWs. As also described in the Recovery Plan (pages 100-101, 198), modified even-aged management with two-aged irregular seed tree or shelterwood harvests retaining the residual trees are compatible with RCWs. The Refuge proposal and methods using modified/irregular even-aged two-aged methods also are compatible with RCW recovery guidelines. Also, the Refuge will conduct foraging habitat analysis by ESA section 7 consultation with the Ecological Services office when stands are regenerated by these methods to ensure that sufficient RCW foraging habitat is retained to avoid an adverse effect and incidental take. The application and use of these methods do not constitute a violation of the ESA. In regards to timber management and timber harvest, trees of all ages may be removed as determined necessary to provide habitat for wildlife, such as the red-cockaded woodpecker. Timber value and maximum sustainable yield play no role in the management of forests at the refuge.

**Comment:** Instead of even-aged forest management methods for RCWs, uneven-aged methods must be used consistent with the RCW Recovery Plan.

---

**Service Response:** The proposed plan includes group selection and patchcuts that would be considered uneven-aged methods. According to the RCW Recovery Coordinator, uneven-aged loblolly pine management for RCW recovery has not been commonly or effectively demonstrated without periodic and extensive applications of herbicide to control hardwoods. The U.S. Forest Service Southern Research Station, working primarily in the Crossett Experimental Forest in south-central Arkansas, has developed and successfully demonstrated successful uneven-aged loblolly pine management methods (e.g. Baker et al. 1996)<sup>5</sup>. Establishing and sustaining successful pine regeneration while controlling hardwood competition and subsequent hardwood encroachment with prescribed fire alone has not been achieved without the periodic application of herbicides at 10-year intervals or more frequently (Cain 1993, Shelton and Cain 2000, Cain and Shelton 2002). Because loblolly pine seedlings and small saplings are vulnerable to fire, the exclusion of fire during regeneration periods or the use of infrequent low intensity dormant season fire also enables the release of competing hardwoods. The Refuge does not anticipate implementing uneven-aged management methods for RCWs on a large-scale during the next 15-year period because of the associated and required need for hardwood and competition control by extensive herbicide applications. As uneven-aged loblolly pine methods for RCW recovery continue to be explored and implemented, uneven-aged loblolly pine management on the Refuge also will be carefully implemented. As described in the RCW Recovery Plan, uneven-aged management is not the only silvicultural method compatible with RCW recovery. As previously described and consistent with the Recovery Plan, compatible irregular shelterwood and seedtree method of regeneration also will be used.

**Comment:** Red-cockaded woodpecker home ranges and foraging partitions should not be analyzed or based on round circles but mapped to areas of actual use.

---

**Service Response:** No information is available at this time on actual home ranges and territories for each active RCW cluster and group on the Refuge. The method for allocating foraging habitat to existing active clusters and future recruitment clusters followed the guidelines of the 2003 RCW Recovery Plan and the Service's Assistant Regional Director, Ecological Services, 2005 memorandum and guidance on conducting foraging habitat analysis. By these methods, each RCW group is allocated foraging habitat within a 0.5 mile radius of the cluster center as a partition. Where adjacent RCW clusters are closer than 1 mile apart and designated partitions overlap, the overlapping areas are subdivided and allocated to each RCW cluster as Thiessen polygons. Convery (2002), Convery and Walters (2004), and McKellar et al. (2013)<sup>6</sup> studied and compared actual RCW home range territory use to the area allocated by these methods as foraging partitions. They found that allocated partitions reasonably and accurately portrayed the estimated RCW territory with the exception of very small partitions, particularly in dense aggregations nearby clusters. For the purposes of the Refuge plan, we allocated foraging habitat – particularly for future recruitment clusters – with an objective of at least 300 acres in each partition. These partitions are of suitable size and density to reasonably represent habitat likely to be used by respective RCWs in the allocated clusters.

**Comment:** The Refuge objective of managing RCW habitat to achieve the managed stability standard (MSS) is inappropriate, contradicts the recovery standard, and is a violation of the ESA.

**Service Response:** The Refuge's management objective for establishing and sustaining RCW foraging habitat is not the MSS. The objective is to restore and sustain habitat while improving habitat conditions to achieve the recovery standard of GQFH. Due to the density and proximity of many of the current active partitions to each other, 23 of these 29 (79%) active clusters and partitions have 300 acres or less of manageable pine. A critical problem to sustain long-term foraging habitat is to begin to ameliorate the lack of sufficient younger pine age-classes to replace older pine before older stands senesce due to natural pine mortality and cease to provide suitable foraging habitat. The ability to establish and continually sustain 120 acres of GQFH in these partitions will be limited because of the partition size and need to establish younger pine age-classes. With regeneration to establish younger age-classes, there will be a temporary reduction in the amount and quality of foraging habitat. When reduced by such treatments, a foraging habitat analysis will be conducted to ensure that sufficient habitat remains to fulfill or positively surpass the MSS to avoid an adverse effect and incidental take. In contrast, future recruitment clusters and partitions were established in spatially explicit manner to provide a sufficient foraging area and habitat to establish and sustain GQFH while also creating sustainable habitat to eventually replace the older pine age-classes. The MSS is an appropriate standard to assess potential impacts of forest management treatments to avoid adverse effects. The use of the MSS in this capacity is not a violation of the ESA, but is an action to comply with the ESA.

---

**Comment:** 1) Save mature pines and do not harvest timber; 2) Large trees of all species should be allowed to senesce, die and decay as an important resource for insects; 3) No commercial harvesting; 4) Why remove all trees during a beetle outbreak?

**Service Response:** It is the goal of refuge management to achieve refuge purposes, System mission and maintain and restore, where appropriate, the biological integrity, diversity and environmental health of the National Wildlife Refuge System. In areas that have been previously disturbed, it is often necessary to use active management techniques to accomplish this goal. Harvest of timber, including mature pines, is frequently required to meet the long-term needs of wildlife, particularly that of the red-cockaded woodpecker. The Recovery Plan for the Red-cockaded Woodpecker defines habitat conditions needed to meet Good Quality Foraging Habitat. Timber harvest and pine forest management is the only method for meeting these requirements. However, these actions should be taken to produce a sustainable forest comprised of a range of various aged trees extending from very young to very old. As discussed within the individual management unit sections, active management and timber harvest is only planned in those units in which it is required to meet the needs of wildlife. Individual large trees shall often be allowed to reach senesce, die and naturally decay within the forest. Trees associated with bug outbreaks within pine habitats will only be removed to the degree needed to protect cavity and foraging habitat for the red-cockaded woodpecker. Not all insect infested trees need to be cut or would be cut.

**Comment:** Red-cockaded Woodpecker population should not be considered at the edge of their range.

**Service Response:** Comment noted. Text referencing comment will be removed from the document. .

**Comment:** Use of the term nesting trees should be changed to nesting and roost cavities.

**Service Response:** Comment noted. Changes were made to the document to reflect comment. .

**Comment:** 1) Strongly oppose use of seed-tree and two-age silvicultural techniques for management of habitat for red-cockaded woodpeckers; 2) even-aged management should be abandoned.

**Service Response:** These methods of forestry are viable techniques for the successful long-term management of habitat for red-cockaded woodpeckers as described in CCP. Until uneven-aged methods are proven for the successful regeneration of loblolly forest, use of these methods will be required at some level as we proceed with management toward long-term Good Quality Foraging Habitat. Uneven-aged management is a method that will be evaluated for possible future management. A project was added to Chapter 5 to include experimental forest management using uneven-aged techniques.

**Comment:** Longleaf pine should not be planted on the refuge.

---

**Service Response:** Noxubee is outside the published historic range of longleaf pine, however, a few isolated occurrences of individual 70-year old longleaf pine trees with active natural regeneration are found on the refuge in the Bevil Hill area. There are no plans to conduct planting of large acres of longleaf pine but research and monitoring related to encouraging long-lived pines species will continue.

**Comment:** 1) Red-cockaded woodpecker should continue to be managed within Management Units 1, 3 and 4; 2) Management Unit 16 should be managed for red-cockaded woodpeckers.

**Service Response:** As described within the HMP, the active clusters within Management Unit 3 will continue to be managed to provide Good Quality Foraging Habitat for Red-cockaded Woodpeckers. One clarification will be made within the document referencing that one recruitment cluster may also be managed for Good Quality Foraging Habitat of this unit that historically supported pine. The remaining units will be managed as described within the HMP for historic conditions as spatial analysis for placement of RCW partitions did not support establishment of partitions in Management Units 1 and 2. The analysis did, however, support possible establishment of three recruitment partitions within Management Unit 4. Management Unit 16 has never been known to be occupied by red-cockaded woodpeckers, but spatial analysis revealed the unit does support sufficient pine habitat for establishment of future recruitment partitions and the objectives for this unit have been changed to show RCW as the primary resource of concern.

**Comment:** Assessment of hydrology and water quality is inadequately addressed regarding logging activities.

**Service Response:** The first level of protection provided by the plan for hydrology and water quality was in the design of the Management Units. Lakes and major waterways are identified as separate management units. The plan also adopted Mississippi's Best Management Practices to protect streamside management zones and water quality and developed refuge specific standards that would protect at least 80% of the diversity located in wetland areas (Objective A.7.1). Through each of these measures, logging activities are expected to have minimal impacts on hydrology and water quality.

**Comment:** Morgan Hill should be maintained at 84 acres.

**Service Response:** The Morgan Hill Demonstration Prairie is not a true prairie and does not have black-belt prairie soils. The historic condition of the area is as a pine dominated forest. This area was established in partnership with the Friends of Noxubee Refuge Inc. and was being managed under an agreed plan by the Friends of Noxubee Refuge. This project is no longer being seen as a priority by the Friends and management of the area has lapsed. Due to its recognized importance as a demonstration prairie, the refuge will attempt to continue the maintenance of the area but at a reduced size and return the remaining area to a forested condition for the possible future use by red-cockaded woodpeckers.

**Comment:** I would like to see more than 50% of the Morgan Hill area as a place that will remain in prairie-like habitat, being burned every 2 or 3 years at least.

**Service Response:** Comment noted.

**Comment:** Connecting People with Nature Trail will impact plants, insect and birds.

---

**Service Response:** In the CCP, Strategy D.3.1.6 describes the proposed location for the Connecting People with Nature wildlife observation trail for use by both bicycles and pedestrians. The proposed 8-foot wide trail surface would be hot mix asphalt with elevated boardwalks near wetland areas. The estimated length of the designated trail is approximately 8 miles. Over the entire length of the trail, approximately 6.2 miles would exist on currently disturbed ground including refuge administrative roads, fire breaks and routinely mowed lawn and would require no additional clearing of forested habitat. Construction of the remaining 1.8 miles of trail would include establishment of raised boardwalks in wetland areas and new trails within forested habitats. Other than approximately 0.2 miles of the trail located along the shore of Bluff Lake, the new disturbed areas would parallel current public road and avoid the need to remove significant habitat including overstory trees. Construction would disturb the surface of the ground in all areas and temporary construction noises would likely disturb nearby wildlife. Use of the trail by the public could disturb wildlife but should quickly become habituated to the activity. The areas within which the trail is being created is currently open to public use with approximately 3.5 miles of the area for which the trail is proposed receiving high levels of public visitation by walkers, bicyclist, and anglers. Wildlife Observation activities are currently occurring throughout the area. All construction would be coordinated with regional archeological and engineering staff.

**Comment:** Concern about impacts if planned management occurs within short time frame.

**Service Response:** Implementation of the plan is contingent on funding and staff resources. Each annual work plan over the life time of this 15-year plan will address only a small portion of the total intended management. The goals of management actions are to provide improved conditions for wildlife. When implementing forest management prescriptions or other on-the-ground work within the refuge, both staff and contractors will follow Mississippi's Best Management Practices. The EA discusses anticipated impacts from planned activities.

**Comment:** Care needs to be taken when conducting prescribed fire and application of pesticides do not unnecessarily impact insects.

**Service Response:** Comment noted. As described under management for Wood Duck, more areas will be encouraged colonized by buttonbush; a plant important to butterflies as well. Roadside management (Draft CCP/EA Strategies A.4.3.2; 8.2.1; 8.2.3; D.1.4; D.6.2; D.6.2.1; E.1.1.4; E.4.1.1; E.4.1.2) will encourage greater protection and habitat opportunities for a variety of wildlife. Prescribed fire within burn units are conducted encourage the growth of herbaceous plants. It is not the goal to produce uniformly burned areas. The refuge will attempt to incorporate research and monitoring targeting the impacts of prescribed fire on insects.

**Comment:** Stop roadside spraying by county work crews on refuge roads.

**Service Response:** All spraying of chemicals on refuge lands must comply with the Service's pesticide use proposal system. The refuge continues to coordinate with local officials on county spraying activities in areas where the refuge has jurisdiction

**Comment:** How will secretive marsh birds be managed on the refuge?

**Service Response:** Secretive marsh birds (i.e., rails and bittern) will receive no direct management focus but are expected to benefit from management of lakes and wetlands for wading birds and waterfowl.

---

**Comment:** 1) There is an inaccurate portrayal of RCW distribution.2) Recommend numbering the clusters on maps in the CCP and HMP.

**Service Response:** Figure 13 of the CCP has been modified to show both the location of current active and proposed recruitment partitions.

**Comment:** Facilitation corridors of suitable habitat leading towards other areas that could support RCWs.

**Service Response:** Management Unit 16 and 17 have the long-term management objective of providing habitat for red-cockaded woodpeckers. These units are located adjacent to pine dominated acres located on both private and public lands into which birds can disperse in both western and southern directions. There is no suitable non-refuge habitats located to the north or east of the refuge to which red-cockaded woodpeckers should be expected to disperse.

**Comment:** 1) Burning on Hwy 25 should be no excuse not to burn the northern units. 2) In several places in the HMP it is stated or implied that fire has not been used because of Highway 25. Because fire has been used in the area before, we believe that with careful planning fire can be used again but with more frequency than in the past (at least once every 3-4 years). Using the northern units will also help safeguard against habitat and RCW loss through catastrophic events (tornados, straight-line or thunderstorm-generated winds, for example) in Management Units 17 and 11 while providing more genetic diversity, thus making the entire Refuge RCW population more viable.

**Service Response:** It is the combination of multiple factors that inhibit burning within areas west of Highway 25. Proximity of the forest stands to Hwy 25, Oktibbeha County Airport and Starkville, MS limit the conditions under which burns can be conducted. In addition, natural site conditions that possess high levels of ground moisture also impeded burning efforts. The realized burning interval for the majority of lands located west of Highway 25 is greater than 5 years and in some locations up to 10 years.

**Comment:** How is fire used, when is it used, where is it used, and what measurements are taken to protect RCW cavity trees?

**Service Response:** Prescribed fire is used to restore and maintain suitable habitat. The refuge utilizes both dormant and growing season burns. Growing season burns generally used to control hardwood growth and encourage growth of grasses and forbs. Dormant season burns are conducted to reduce fuel loads and reduce risk of wild fire. Prescribed fire is practiced in all RCW managed habitat. The refuge mitigates risks through use of fire lines and by raking fuel away from locations where fuels are hazardous or determined unwanted by fire crew and refuge Biologist. Fire crews also use a variety of firefighting equipment including ATVs with a water source to protect trees during prescribed burns.

**Comment:** Surveys should be conducted and areas being used by these species should be protected (e.g. least bittern, king rail, pied-billed grebe. (There is no discussion of how wetlands will be managed for secretive marsh birds, especially King Rail and Least Bittern, which are of critical concern locally and appear to be extirpated by recent management activities on the refuge. Proper management could possibly lead to the reestablishment of these species on the refuge.)

---

**Service Response:** The CCP development team which included staff and experts from a variety of agencies agreed that the refuge plays only a very minor role in providing habitat for these secretive marsh birds and for that reason goals and objectives for this group of birds was not included in the CCP. However, these birds should benefit from management actions associated with waterfowl, wading birds and fisheries including providing shallow water habitats and management of aquatic plants.

**Comment:** Management activities that negatively impact colonial nesting birds should be avoided. Annual surveys should be conducted to monitor the number of nesting pairs each year.

**Service Response:** The areas around known colonial nesting birds is closed to all activities during the nesting season and the refuge has on ongoing citizen science program that helps in monitoring the yearly status of the colonies.

**Comment:** Efforts at aquatic weed control should consider the needs of purple gallinule and common gallinule, and some habitat should be maintained for them. Annual surveys should be conducted to monitor the number of nesting pairs each year.

**Service Response:** As noted in the HMP, lotus, the main aquatic weed being controlled is American lotus which will be kept to no more than 25% of the lakes surface. This amount of lotus should be sufficient for the number of gallinule using the refuge. If possible the refuge will seek citizen scientist to monitor bird numbers but monitoring of these birds is not a priority activity given current staffing and funding.

**Comment:** The two bald eagle nests on the refuge should be protected and kept free from excessive disturbance. Nests should be monitored, and nesting success recorded.

**Service Response:** The areas around known eagle nesting sites are closed to all activities during the nesting season and the refuge has on ongoing citizen science program that helps in monitoring the yearly status of the colonies.

**Comment:** When nesting locations are discovered for the yellow-crowned night heron, they should be protected.

**Service Response:** Yellow-crowned night heron are considered part of the refuges colonial nesting bird population. The areas around known colonial nesting birds is closed to all activities during the nesting season and the refuge has on ongoing citizen science program that helps in monitoring the yearly status of the colonies.

**Comment:** Wood duck boxes should be maintained for use of hooded mergansers.

**Service Response:** A limited (up to 150) number of wood duck boxes are maintained using citizen scientist and volunteers (see page 168 of CCP). The refuge does not restrict hooded mergansers from using these boxes.

**Comment:** Management to revive the quail population should be conducted.

**Service Response:** Northern bobwhite quail populations are expected to benefit greatly from management for GQFH for red-cockaded woodpeckers that improves grass and forb development within the pine dominated forests.

---

**Comment:** Large pines in bottomlands should be maintained for the yellow-throated warbler.

**Service Response:** Comment noted.

**Comment:** Habitat for scarlet tanagers should be preserved.

**Service Response:** Comment noted.

**Comment:** Large dead snags in open areas, such as RCW clusters should be kept as potential nesting sites for American kestrels.

**Service Response:** Comment noted.

**Comment:** Any management activities around the lakes or in bottomland forest should specifically consider the impact they will have on migrant songbirds.

**Service Response:** The EA in the Draft CCP (page 157) discusses impacts of habitat management within these habitat types.

**Comment:** An effort should be made to create shorebird habitat like that present in the 1990's, including the control of American Lotus in areas that would be frequented by shorebirds. The timing of lake drawdowns are also important, with the greatest species diversity of migrant shorebirds occurring in August and September.

**Service Response:** Shorebirds are not plentiful on the refuge but management of refuge lakes and moist soil areas for waterfowl, wading birds and Wood stork should greatly benefit a variety of shorebird species as described throughout the CCP and HMP.

**Comment:** Wetlands on Noxubee NWR should continue to be managed to attract waterfowl, but consideration should also be given to species such as Marsh Wrens and rails that prefer shallower water and denser, emergent vegetation such as reeds.

**Service Response:** See response for marsh birds and shorebirds.

**Comment:** Additional intensive surveys for other groups of insects should be conducted, so that the fauna of Noxubee NWR is better understood and informed management decisions can be made.

**Service Response:** The refuge has an ongoing citizen science program that helps in monitoring the yearly status of a variety of wildlife. The refuge continues to develop its longtime relationship with the entomologist at Mississippi State University and promotes continuing and new research and monitoring activities with the University.

**Comment:** Rough-leaved Dogwoods are particularly important and have a limited distribution on the refuge. In the past, some of the best of these plants were unnecessarily destroyed during routine refuge management; they should be protected where possible.

**Service Response:** Comment noted.

---

**Comment:** Some important plants have been lost in the past due to burning during low water levels or to routine management. The concentration of butterflies on stands of Joe Pye Weed along Section Line Road can be truly spectacular, and these plants should be protected.

**Service Response:** The refuge recognizes the importance of insects including butterflies within its management of the refuge. As staff learns more about the needs of these species, refuge managers will adaptively adjust management actions to prevent unnecessary impacts.

**Comment:** Burns should not be conducted every year, as populations of insects need time to recover after a burn. (There is no discussion of managing controlled burns so as not to eliminate arthropod populations. Only portions of an area of similar habitat should be burned in a given year, so that there is a source population to recolonize the area that is burned. Repeated burning of entire areas of a given habitat year after year, or even in a single year, will eliminate biodiversity rather than protect it. This could be particularly true on small areas of unique habitats such as that present at Morgan Hill. Fall burns here will eliminate food for wintering sparrows.)

**Service Response:** Very infrequently is the same area burned on a yearly basis. The only location on the refuge planned for a yearly burn is the demonstration prairie unit. It is the pine dominated forested habitats that receive the majority of the refuge prescribed fire management activities and fire will generally not carry through any one stand or area if burned yearly because it takes some time for new fuel to build up enough to carry a fire successfully through a forest.

**Comment:** The critical point is that a “good” prescribed burn is a patchy burn that leaves areas of unburned habitat; burns should not be conducted at the same site every year; and various portions of a site should be burned at different times of year. The burns at Noxubee tend to be large and leave little unburned habitat.

**Service Response:** It is not the intention to uniformly burn the forest floor and this is one reason the refuge does not aerially ignite fires which drops fire in a uniform pattern through the given area. Refuge fires are generally set along edges and allowed to pass through a forest on its own initiative. This naturally leaves many areas left unburned within the area. Prescribed fire within the pine dominated forests is being used to promote GQFH for red-cockaded woodpeckers and to be successful a large proportion of any area needed to be successfully burned, otherwise this species of highest management importance would not benefit.

**Comment:** Attempts to eradicate the population of Argentine Ant (*Linepithema humile*) established around the refuge headquarters should be taken before the species becomes widespread on the refuge.

**Service Response:** The refuge has and continues to attempt to eradicate all exotic plants and animals from the refuge. Attempts to remove the ants has been attempted, continues but at this time has failed to provide complete eradication.

**Comment:** These attachments were provided as reference for a comment to be made part of the record.

---

Attachment A: 2011 60 Day Notice letter to the Service regarding management of the Refuge, included to demonstrate that the Service's desire to increase timber harvest at the Refuge predates the new information that the DCCP/EA's proposal to do so ostensibly is based upon.

- Attachment B: First Amended Complaint, Northern District of Mississippi (1:12- cv-00005-SA-DAS), challenging prior efforts by the Service to manage the Refuge for timber production rather than needs of wildlife.
- Attachment C: October, 25, 2011 letter to the Service regarding the inconsistency of managing the Refuge for timber production, which holds true also for the current planning and concurrency determinations. Attachments to this letter are in the possession of the Service and should be incorporated by reference into the record for this decision.
- Attachment D: M. King, J.H. Carter, 2011 and 2012 Red-Cockaded Woodpecker Aerial Survey on Public Lands Bordering the West Side of the Alligator River and Roper Island, Hyde and Tyrrell Counties, North Carolina (Apr. 23, 2012), included to demonstrate the great variety of habitats used by RCW, undermining the a DCCP/EA's argument that historical forest conditions of mixed hardwood/pine mandate a decrease in the Recovery goal at the Refuge.<sup>1</sup>
- Attachment E: J.H. Carter, K. Brust, The Red-Cockaded Woodpecker in the Northeastern Coastal Plain of North Carolina, included for the same reasons Attachment D is included.
- Attachment F: A.E. McKeller, D.C. Kesler, R.J. Mitchell, D.K. Delaney, J.R. Walters, Geographic variation in fitness and foraging habitat quality in an endangered bird, "Biological Conservation," 175: 52-64 (2014), included for the same reasons as Attachment D.

**Service Response:** The attachments provided were considered in formulation of edits and responses to public comments. In addition, as part of the 2012 Settlement Agreement (Case No. 1:12-cv-00005-SA-DAS dated June 15, 2012), the refuge agreed to the following:

Federal Defendants will prepare a new Comprehensive Conservation Plan for the Refuge ("New CCP") to replace the one completed in 2004. The Parties agree that this process will include:

- Preparation of an Environmental Assessment ("EA") or an Environmental Impact Statement ("EIS"), as appropriate;
  - Reference Draft CCP page 123 or Section B
- Preparation of a Forest Habitat Management compatibility determination ("CD"); and
  - Reference Draft CCP 2014 Appendix F
- Consultation under Section 7 of the ESA with FWS' Ecological Services on potential effects of the New CCP on the red-cockaded woodpecker ("RCW") at the Refuge.
  - Section 7 drafted 2-01-14 and sent to FWS' ES on 2-15-14

Without making any substantive commitments with respect to the content, analysis, or conclusions that will be contained in the New CCP, the Parties agree that the following issues will be considered in the administrative process of preparing the New CCP:

- The Recovery Standard for managing foraging habitat (as set forth in the

---

2003 RCW Recovery Plan) for the RCW at the Refuge;

- ⊕ Reference 2014 Draft EA pages: (Chapter III) 137, 143, 144 (Chapter IV) 198, 199

**Comment:** I disagree with the continued use of translocation as the means of moving birds – sometimes to very distant areas in very different habitats.

**Service Response:** There are no plans to translocate birds within the local population. Any translocations that may occur would be coordinated with the RCW Recovery Coordinator and addressed outside the scope of this plan.

---

**Comment:** I am in favor of minimal or no entry cuts into the bottomland hardwoods providing canopy openings which would encourage shade intolerant species to sprout.

**Service Response:** To meet the needs of a variety of wildlife including those identified priority wildlife species, shade intolerant plant species such as the refuge's oaks require greater amounts of light to reach the forest floor in order to successfully grow and be recruited into the forest canopy. Whether the removal of a single tree or a group of trees is needed to produce the desired effect is site specific and address on a case by case basis. Following guidelines develop through the Mississippi Joint Venture; management including providing of canopy opening is necessary but carefully balanced against unwanted impacts. As noted on page 77 of the Draft CCP/EA, by following the publication outlining the Desired Forest Conditions the refuge plans to meet the needs of its priority wildlife species.

**Comment:** The plan calls for a lot of the grassy fields to be left to grow with no cutting or burning. The overgrowth will result in no butterflies using the grasses or native wildflowers. North American Butterfly Count data will show the different species of butterflies and skippers that use the open grassy fields. A lot of grassland birds are in danger of losing this habitat, too. Please set aside grass fields for these species.

**Service Response:** The refuge will continue to maintain grassy and native wildflowers along much of its roadways and fields located outside areas needed for the management of the red-cockaded woodpeckers. The refuge will adaptively manage these areas as new knowledge is obtained related to the needs of these species. In addition, these insect species should obtain greater benefit from managing for GQFH for red-cockaded woodpeckers that also benefit indirectly from an increase in grasses and forbs grown within the pine dominated forested habitats.

**Comment:** In reference to Objective A.8.3, Strategy A.8.3.1, we recommend adding Strategy A.8.3.2 indicating a zero tolerance policy for hogs and cogongrass for any alternative. Effort should be made to eradicate either wherever detected.

**Service Response:** Commented noted. Strategy A.8.3.2 has been added.

---

## VISITOR SERVICES

**Comment:** It would be nice to have a paved trail on the refuge for people with disabilities.

**Service Response:** In the CCP, Strategy D.3.1.6 describes the proposed location for the Connecting People with Nature wildlife observation trail for use by both bicycles and pedestrians. This would be a paved trail meeting ADA compliance.

**Comment:** Only nontoxic ammunition should be allowed on the refuge.

**Service Response:** As shown in the refuge Public Use Brochure and Code of Federal Regulations, toxic shot and lead ammunition is not allowed by the public within identified green-tree reservoirs and areas with open water. Consistent with Mississippi Department of Wildlife, Fisheries and Parks, lead ammunition is allowed for the hunting of game species on the refuge. At this time there is no indication that hunter deposited toxic ammunition is impacting the refuge wildlife or environment. Target shooting and the discharge of fire arms outside of hunting seasons is not permitted on the refuge.

**Comment:** 1) Hunting should be allowed within the connecting people with nature area; 2) Stop all hunting.

**Service Response:** The approximate 4,000-acre area to be designated as the Connecting People with Nature area represents about 8% of the refuge land. The majority of the proposed area is already closed to hunting or access by hunters. The refuge receives an estimated 160,000 visits yearly with 70% of these being non-hunting related visits. Another 2% of the refuge is closed to hunting to prevent disturbance to waterfowl. Approximately 90% of the refuge is available for a wide variety of dispersed hunting activities and the designated connecting people with nature area will have little impact on hunters.

Hunting is needed to keep deer populations to levels at which they do not have a negative impact on habitat. Hunting of other game is very much represented within the local heritage and allows people a unique opportunity to connect with nature and experience the nature in manner that has not changed in hundreds of years. Hunting is one of the six priority public uses specified in the National Wildlife Refuge Improvement Act of 1997. The Service allows hunting as long as it is compatible with the mission of the Service, the National Wildlife Refuge System, and the purposes of the refuge.

**Comment:** 1) Fees should be limited to hunting community only; 2) Increase fees for hunters by 2,000 percent.

**Service Response:** The recreational fee program allows for the collection of entrance and expanded amenity fees. At least 80 percent of the collections return to the specific site of collection to offset program costs and enhanced visitor facilities and programs. With 160,000 visits yearly of which approximately 112,000 are not associated with hunting, demand for upgraded facilities and expanded amenities continues to increase. Without additional fees to offset program cost, visitor facilities and programs will need to be reduced. To generate the needed offset from only hunters would result in at least tripling of fees for this user group.

**Comment:** What is the future of Craig pond trail? Would it be possible to do minimum maintenance or partner with the FONR or Audubon to do some cooperative maintenance?

---

**Service Response:** As described by Strategy D.3.1.3, page 98, the Craig Pond Trail will no longer be maintained. The public will be allowed to use the area but the maintained trail will be discontinued as part of the refuge's Experiencing Nature Area. Developed trails will be limited to the Connecting People with Nature Area and the Scattertown Trail.

**Comment:** Quail and woodcock should be included for use of hunting dogs (Draft CCP page 57-58).

**Service Reponse:** Comment noted. Text clarified.

**Comment:** Regulations for SDHN NWR lists squirrel and rabbit as following state seasons, but squirrel and rabbit are currently not 100% concurrent season dates with recent statewide framework change (Draft CCP page 58).

**Service Reponse:** Comment noted. Text clarified.

**Comment:** Addressing Strategy D.1.2.2, we recommend using the criteria that has been established on MDWFP Wildlife Mangament Ares- MS Admin Code Title 40 Part 2 Chapter 2 Rule 1.4 Special Use Regulation for Individuals with Disabilities.

**Service Reponse:** Comment noted. Text clarified.

#### *RESOURCE PROTECTION*

**Comment:** The term slaveholding should not be used in describing farms of the late 1800's since slavery ended prior to that period.

**Service Reponse:** Comment noted. Text clarified.

**Comment:** Are there any structures that were created greater than 50 years ago?

**Service Reponse:** Yes. Text clarified.

**Comment:** A comprehensive refuge wide cultural resources survey should be conducted.

**Service Reponse:** Comment noted. Chapter 5, Project 7 proposes such a survey.

#### *ADMINISTRATION*

**Comment:** The refuge is underfunded and understaffed.

**Service Response:** Comment noted.

#### *ENVIRONMENTAL ASSESSMENT*

**Comment:** Alternatives A, B and C are not substantially different.

**Service Response:** Table 10 (page 141) of the Draft CCP/EA summarizes the difference among the alternatives.

---

**Comment:** Insufficient alternatives analysis did not include alternatives A and B.

**Service Response:** See Chapter 4 of the Draft CCP/EA (page 157) for an analysis of all three alternatives.

---

## *Appendix E. Appropriate Use Determinations*

### **Sam D. Hamilton Noxubee National Wildlife Refuge Appropriate Use Determinations**

An appropriate use determination is the initial decision process a refuge manager follows when first considering whether or not to allow a proposed use on a refuge. The refuge manager must find that a use is appropriate before undertaking a compatibility review of the use. This process clarifies and expands on the compatibility determination process by describing when refuge managers should deny a proposed use without determining compatibility. If a proposed use is not appropriate, it will not be allowed and a compatibility determination will not be undertaken.

Except for the uses noted below, the refuge manager must decide if a new or existing use is an appropriate refuge use. If an existing use is not appropriate, the refuge manager will eliminate or modify the use as expeditiously as practicable. If a new use is not appropriate, the refuge manager will deny the use without determining compatibility. Uses that have been administratively determined to be appropriate are:

- Six wildlife-dependent recreational uses - As defined by the National Wildlife Refuge System Improvement Act of 1997, the six wildlife-dependent recreational uses (hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation) are determined to be appropriate. However, the refuge manager must still determine if these uses are compatible.
- Take of fish and wildlife under state regulations - States have regulations concerning take of wildlife that includes hunting, fishing, and trapping. The Service considers take of wildlife under such regulations appropriate. However, the refuge manager must determine if the activity is compatible before allowing it on a refuge.

#### **Statutory Authorities for this policy:**

**National Wildlife Refuge System Administration Act of 1966, as amended by the National Wildlife Refuge System Improvement Act of 1997, 16 U.S.C. 668dd-668ee.** This law provides the authority for establishing policies and regulations governing refuge uses, including the authority to prohibit certain harmful activities. The Improvement Act does not authorize any particular use, but rather authorizes the Secretary of the Interior to allow uses only when they are compatible and “under such regulations as he may prescribe.” This law specifically identifies certain public uses that, when compatible, are legitimate and appropriate uses within the Refuge System. The law states “. . . it is the policy of the United States that . . . compatible wildlife-dependent recreation is a legitimate and appropriate general public use of the System . . . compatible wildlife-dependent recreational uses are the priority general public uses of the System and shall receive priority consideration in refuge planning and management; and . . . when the Secretary determines that a proposed wildlife-dependent recreational use is a compatible use within a refuge, that activity should be facilitated . . . the Secretary shall . . . ensure that priority general public uses of the System receive enhanced consideration over other general public uses in planning and management within the System . . . .” The law also states “in administering the System, the Secretary is authorized to take the following actions: . . . issue regulations to carry out this Act.” This policy implements the standards set in the Improvement Act by providing enhanced consideration of priority general public uses and ensuring other public uses do not interfere with our ability to provide quality, wildlife-dependent recreational uses.

---

**Refuge Recreation Act of 1962, 16 U.S.C. 460k.** The Act authorizes the Secretary of the Interior to administer refuges, hatcheries, and other conservation areas for recreational use, when such uses do not interfere with the area's primary purposes. It authorizes construction and maintenance of recreational facilities and the acquisition of land for incidental fish and wildlife oriented recreational development or protection of natural resources. It also authorizes the charging of fees for public uses.

**Other Statutes that Establish Refuges, including the Alaska National Interest Lands Conservation Act of 1980 (ANILCA) (16 U.S.C. 410hh - 410hh-5, 460 mm - 460mm-4, 539-539e, and 3101 - 3233; 43 U.S.C. 1631 et seq.).**

**Executive Orders.** The Service must comply with Executive Order 11644 when allowing use of off-highway vehicles on refuges. This order requires the Service to designate areas as open or closed to off-highway vehicles in order to protect refuge resources, promote safety, and minimize conflict among the various refuge users; monitor the effects of these uses once they are allowed; and amend or rescind any area designation as necessary based on the information gathered. Furthermore, Executive Order 11989 requires the Service to close areas to off-highway vehicles when it is determined that the use causes or will cause considerable adverse effects on the soil, vegetation, wildlife, habitat, or cultural or historic resources. Statutes, such as ANILCA, take precedence over executive orders.

**Definitions:**

**Appropriate Use**

A proposed or existing use on a refuge that meets at least one of the following four conditions:

- 1) The use is a wildlife-dependent recreational use as identified in the Improvement Act.
- 2) The use contributes to fulfilling the refuge purpose(s), the Refuge System mission, or goals or objectives described in a refuge management plan approved after October 9, 1997, the date the Improvement Act was signed into law.
- 3) The use involves the take of fish and wildlife under state regulations.
- 4) The use has been found to be appropriate as specified in Section 1.11.

**Native American.** American Indians in the conterminous United States and Alaska Natives (including Aleuts, Eskimos, and Indians) who are members of federally recognized tribes.

**Priority General Public Use.** A compatible wildlife-dependent recreational use of a refuge involving hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation.

**Quality.** The criteria used to determine a quality recreational experience include:

- Promotes safety of participants, other visitors, and facilities.
- Promotes compliance with applicable laws and regulations and responsible behavior.
- Minimizes or eliminates conflicts with fish and wildlife population or habitat goals or objectives in a plan approved after 1997.
- Minimizes or eliminates conflicts with other compatible wildlife-dependent recreation.
- Minimizes conflicts with neighboring landowners.
- Promotes accessibility and availability to a broad spectrum of the American people.
- Promotes resource stewardship and conservation.

- 
- Promotes public understanding and increases public appreciation of America's natural resources and the Service's role in managing and protecting these resources.
  - Provides reliable/reasonable opportunities to experience wildlife.
  - Uses facilities that are accessible and blend into the natural setting.
  - Uses visitor satisfaction to help define and evaluate programs.

*Wildlife-Dependent Recreational Use.* As defined by the Improvement Act, a use of a refuge involving hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation.

### FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Sam D. Hamilton Noxubee NWR

Use: Bee Keeping

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	X	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	X	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	X	
(d) Is the use consistent with public safety?	X	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?		X
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?	X	
(g) Is the use manageable within available budget and staff?		X
(h) Will this be manageable in the future within existing resources?		X
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?		X
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	X	

Where we do not have jurisdiction over the use ["no" to (a)], there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ["no" to (b), (c), or (d)] may not be found appropriate. If the answer is "no" to any of the other questions above, we will generally not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes: X No:

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate: X	Appropriate:
<input type="checkbox" value="Signed"/> Signed	
Refuge Manager: _____ Date: <u>12/19/14</u>	

If found to be Not Appropriate, the refuge supervisor does not need to sign concurrence if the use is a new use. If an existing use is found Not Appropriate outside the CCP process, the refuge supervisor must sign concurrence. If found to be Appropriate, the refuge supervisor must sign concurrence.

Refuge Supervisor: \_\_\_\_\_ Date: \_\_\_\_\_

A compatibility determination is required before the use may be allowed.

## FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Sam D. Hamilton NWR

Use: Bicycling for Wildlife Dependent Activities

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	X	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	X	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	X	
(d) Is the use consistent with public safety?	X	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?	X	
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?	X	
(g) Is the use manageable within available budget and staff?	X	
(h) Will this be manageable in the future within existing resources?	X	
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?	X	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	X	

Where we do not have jurisdiction over the use ["no" to (a)], there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ["no" to (b), (c), or (d)] may not be found appropriate. If the answer is "no" to any of the other questions above, we will generally not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes: X No:

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate: \_\_\_\_\_      Appropriate: X  
 Refuge Manager: Signed      Date: 12/14/14

If found to be Not Appropriate, the refuge supervisor does not need to sign concurrence if the use is a new use. If an existing use is found Not Appropriate outside the CCP process, the refuge supervisor must sign concurrence. If found to be Appropriate, the refuge supervisor must sign concurrence.

Refuge Supervisor: Signed      Date: 12/23/14

A compatibility determination is required before the use may be allowed.

## FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Sam D. Hamilton Noxubee NWR

Use: Boating for Wildlife Dependent Activities

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	X	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	X	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	X	
(d) Is the use consistent with public safety?	X	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?	X	
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?	X	
(g) Is the use manageable within available budget and staff?	X	
(h) Will this be manageable in the future within existing resources?	X	
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?	X	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	X	

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will generally not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes: X No:

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate: \_\_\_\_\_      Appropriate: X  
Refuge Manager:  Signed      Date: 12/19/14

If found to be Not Appropriate, the refuge supervisor does not need to sign concurrence if the use is a new use. If an existing use is found Not Appropriate outside the CCP process, the refuge supervisor must sign concurrence. If found to be Appropriate, the refuge supervisor must sign concurrence.

Refuge Supervisor:  Signed      Date: 12/23/14

A compatibility determination is required before the use may be allowed.

## FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Sam D. Hamilton Noxubee NWR

Use: Camping

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	X	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	X	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	X	
(d) Is the use consistent with public safety?	X	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?		X
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?		X
(g) Is the use manageable within available budget and staff?		X
(h) Will this be manageable in the future within existing resources?		X
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?		X
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?		X

Where we do not have jurisdiction over the use ["no" to (a)], there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ["no" to (b), (c), or (d)] may not be found appropriate. If the answer is "no" to any of the other questions above, we will generally not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes: X No:

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate: X

Appropriate:

Refuge Manager:

Signed

Refuge Supervisor: <input checked="" type="checkbox"/>	Signed <input type="checkbox"/>
Date: <u>12/23/14</u>	

A compatibility determination is required before the use may be allowed.

## FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Sam D. Hamilton Noxubee NWR

Use: Commercially Guided Wildlife and Nature Observation

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	X	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	X	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	X	
(d) Is the use consistent with public safety?	X	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?	X	
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?	X	
(g) Is the use manageable within available budget and staff?	X	
(h) Will this be manageable in the future within existing resources?	X	
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?	X	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	X	

Where we do not have jurisdiction over the use ["no" to (a)], there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ["no" to (b), (c), or (d)] may not be found appropriate. If the answer is "no" to any of the other questions above, we will generally not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes: X No:

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate: \_\_\_\_\_      Appropriate: X  
Refuge Manager:  Date: 12/19/14

If found to be Not Appropriate, the refuge supervisor does not need to sign concurrence if the use is a new use. If an existing use is found Not Appropriate outside the CCP process, the refuge supervisor must sign concurrence. If found to be Appropriate, the refuge supervisor must sign concurrence.

Refuge Supervisor:  Date: 12/23/14

A compatibility determination is required before the use may be allowed.

---

### FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Sam D. Hamilton NWR

(h) Will this be manageable in the future within existing resources?	X	
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?	X	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	X	

Where we do not have jurisdiction over the use ["no" to (a)], there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ["no" to (b), (c), or (d)] may not be found appropriate. If the answer is "no" to any of the other questions above, we will generally not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes: X No:

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate: X                      Appropriate:  
Refuge Manager: Signed                      Date: 12/19/14

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use. If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence. If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: \_\_\_\_\_ Date: \_\_\_\_\_

A compatibility determination is required before the use may be allowed.

Refuge Name: Sam D. Hamilton Noxubee NWR

Use: **Release of Non-native, Captive, or Feral Wildlife or Plants**

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	X	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	X	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	X	
(d) Is the use consistent with public safety?		X
(e) Is the use consistent with goals and objectives in an approved management plan or other document?		X
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?	X	
(g) Is the use manageable within available budget and staff?		X
(h) Will this be manageable in the future within existing resources?		X
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?		X
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?		X

Where we do not have jurisdiction over the use ["no" to (a)], there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ["no" to (b), (c), or (d)] may not be found appropriate. If the answer is "no" to any of the other questions above, we will generally not allow the use.

## *Appendix F. Compatibility Determinations*

### **Sam D. Hamilton Noxubee National Wildlife Refuge Compatibility Determination**

**Uses:** The following uses were found to be appropriate and evaluated to determine their compatibility with the mission of the Refuge System and the purposes of the refuge.

1. Bicycle Use for Wildlife-Dependent Activities
2. Boating for Wildlife-Dependent Activities
3. Commercial Forest Management Operations
4. Commercial Wildlife and Nature Photography and Filming
5. Commercially Guided Wildlife and Nature Observation
6. Firewood Cutting for Personal Use Only
7. Geocaching for Environmental Education
8. Jogging, Running, and Competitive Races
9. Motorized and Non-Motorized Boating for Wildlife Observation
10. Picnicking in Association with Wildlife-Dependent Activities
11. Recreational Fishing
12. Recreational Hunting of Big Game, Small Game, and Waterfowl
13. Scientific Research
14. Wildlife Observation, Wildlife Photography, Environmental Education, and Interpretation

**Refuge Name:** Sam D. Hamilton Noxubee National Wildlife Refuge, hereafter referred to as the refuge, located in Oktibbeha, Noxubee, and Winston counties in Mississippi.

**Date Established:**

**Establishing and Acquisition Authorities:**

- (1) Migratory Bird Conservation Act (16 U.S.C. 715)
- (2) National Wildlife Refuge System Administration Act (16 U.S.C. 668(a)(2))
- (3) Fish and Wildlife Act of 1956 (16 U.S.C. 742 (b)(1))
- (4) Refuge Recreation Act (16 U.S.C. 460 K-1)

**Refuge Purpose:**

- (1) "...for use as a refuge and breeding ground for migratory birds and other wildlife..." (16 U.S.C. 715; Migratory Bird Conservation Act)
- (2) "...conservation, management, and restoration of the fish, wildlife, and plant resources and their habitats for the benefit of present and future generations of Americans" (16 U.S.C. 668(a)(2))
- (3) "...for the development, advancement, management, conservation, and protection of fish and wildlife resources..." (16 U.S.C. 742 (b)(1))

---

(4) "...incidental fish and wildlife-oriented recreational development" (16 U.S.C. 460k-1; Refuge Recreation Act)

(5) "the protection of natural resources" (16 U.S.C. 460k-1; Refuge Recreation Act)

(6) "the conservation of endangered or threatened species..." (16 U.S.C. 460k-1; Refuge Recreation Act)

### **National Wildlife Refuge System Mission:**

The mission of the Refuge System, as defined by the National Wildlife Refuge System Improvement Act of 1997, is:

*... to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.*

### **Other Applicable Laws, Regulations, and Policies:**

Animal Welfare Act of 1966, Public Law 89-544 (7 U.S.C. 2131 et. seq.)

Antiquities Act of 1906 (34 Stat. 225)

Migratory Bird Treaty Act of 1918 (15 U.S.C. 703-711; 40 Stat. 755)

Migratory Bird Conservation Act of 1929 (16 U.S.C. 715r; 45 Stat. 1222)

Migratory Bird Hunting Stamp Act of 1934 (16 U.S.C. 718-178h; 48 Stat. 451)

Criminal Code Provisions of 1940 (18 U.S.C. 41)

Bald and Golden Eagle Protection Act (16 U.S.C. 668-668d; 54 Stat. 250)

Refuge Trespass Act of June 25, 1948 (18 U.S.C. 41; 62 Stat. 686)

Fish and Wildlife Act of 1956 (16 U.S.C. 742a-742j; 70 Stat. 1119)

Refuge Recreation Act of 1962 (16 U.S.C. 460k-460k-4; 76 Stat. 653)

Wilderness Act (16 U.S.C. 1131; 78 Stat. 890)

Land and Water Conservation Fund Act of 1965

National Historic Preservation Act of 1966, as amended (16 U.S.C. 470, et seq.; 80 Stat. 915)

National Wildlife Refuge System Administration Act of 1966 (16 U.S.C. 668dd, 668ee; 80 Stat. 927)

National Environmental Policy Act of 1969, NEPA (42 U.S.C. 4321, et seq; 83 Stat. 852)

Use of Off-Road Vehicles on Public Lands (Executive Order 11644, as amended by Executive Order 10989)

Refuge Revenue Sharing Act of 1935, as amended in 1978 (16 U.S.C. 715s; 92 Stat. 1319)

Endangered Species Act of 1973 (16 U.S.C. 1531 et seq; 87 Stat. 884)

National Wildlife Refuge Regulations for the Most Recent Fiscal Year (50 CFR Subchapter C; 43 CFR 3101.3-3)

(Title 50 Code of Federal Regulations Subchapter C; 43 CFR 3103.3.3)

Title 50 Code of Federal Regulations, Parts 25-33

Emergency Wetlands Resources Act of 1986 (S.B. 740)

North American Wetlands Conservation Act of 1990

Food Security Act (Farm Bill) of 1990 as amended (HR 2100)

The Property Clause of the U.S. Constitution Article IV 3, Clause 2

---

The Commerce Clause of the U.S. Constitution Article 1, Section 8  
The National Wildlife Refuge System Improvement Act of 1997 (Public Law 105-57, USC668dd)  
Executive Order 12996, Management and General Public Use of the National Wildlife  
Refuge System. March 25, 1996  
Executive Order 11644, Use of Off-Road Vehicles on Public Lands, as amended by E.O. 10989.  
Archaeological Resources Protection Act of 1979  
Native American Graves Protection and Repatriation Act of 1990  
Consolidated Appropriations Act of 2004 - Section 145 of PL 108-199 is known as the  
Theodore Roosevelt National Wildlife Refuge Act

Compatibility determinations for each description listed were considered separately. Although for brevity, the preceding sections from "Uses" through "Other Applicable Laws, Regulations and Policies" and the succeeding sections, "Literature Cited," "Public Review," and the "Approval of Compatibility Determinations" are only written once within the CCP, they are part of each descriptive use and become part of that compatibility determination if considered outside of the CCP.

---

### **Use: Bicycling**

**Description of Use:** Bicycling as a lone activity is not identified as a priority public use of the National Wildlife Refuge System under the National Wildlife Refuge System Improvement Act of 1997 (Public Law 105-57). Bicycles are considered legal modes of transportation on local state and county roads. Like walking, bicycling can be used as transport to wildlife observation and photography areas. Bicycling has also been used by hunters and anglers to reach areas along roads closed to vehicle use. Increasing numbers of visitors are using bicycles on the refuge as a form of exercise with some trails being used by mountain biking enthusiasts.

**Availability of Resources:** Approved compatible public uses will be the primary management focus. Maintenance, periodic upgrades, and improvements to public use facilities and roads will continue to be a major component of refuge activities.

The human resources to conduct a successful public use program will be provided by staff, volunteers, and partners. The Service will have to provide upgraded facilities and require a significant commitment in staff to be able to provide bicycling opportunities beyond that used for hunting and fishing. To date, annual requirements in time, materials, and supplies needed to manage and ensure the success of this area have been from within existing refuge resources. Estimated costs associated with this use include:

Creating "Connecting People with Nature" Bike Route: \$50,000 per mile

Supplies and materials: \$6,000; regulatory signs, interpretative brochures

Monitoring: \$3,000 annually

Law Enforcement: \$3,000 annually

**Anticipated Impacts of the Use:** For a complete analysis of the anticipated impacts of hunting, refer to Chapter IV of the Draft EA.

---

Impacts associated with bicycling as a form of transport for hunters, anglers, and wildlife observers are minimal on the refuge due to this use being limited to the paved or graveled roads and, if developed, some trails within the “Connecting People with Nature” area. Short-term and negligible disturbance to wildlife may occur due to visitor-wildlife encounters. In most cases, wildlife would be expected to become accustomed to the presence of visitors and their associated modes of transportation. Mountain bike activities, both on-trail and off-trail, would be prohibited.

In areas where the distance between trails, roads and wetlands is short, there may be some minor and short-term disturbances to shorebirds associated with bicycling. These areas may be seasonally closed to this use. No significant adverse impacts to non-target species are expected. Negative impacts between concurrent public use activities are not expected and no adverse socioeconomic impacts are anticipated. This use should not result in short- or long-term impacts that adversely affect the purpose for this refuge or the mission of the Refuge System. It is intended that the primary positive impact will be a better appreciation of the role of the Fish and Wildlife Service in the conservation arena.

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

- Use is Not Compatible  
 Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** We will permit bicycling only in designated areas specifically developed to prevent the erosion and degradation of wetlands or water quality and ensure public safety. Bicycles will not be allowed in areas or along trails if there are safety issues or wildlife disturbance issues. Bicycles are allowed for wildlife-dependent activities, including, but not limited to, access related to hunting, fishing, and wildlife observation.

Mountain biking activities and use of bicycles to go cross country or off designated trails will be prohibited.

Bicycle riding as a general mode of transportation is allowed on roads open to motor vehicles. Organized rides and club rides involving more than 10 bicycles will be required to obtain a special use permit as these large groups may require greater management to prevent negative interactions with other public users and wildlife.

---

Motorized vehicle speeds on roadways shared by bicycles will be limited to no higher than 35 miles per hour and 25 miles per hour with the Connecting People with Nature Area.

**Justification:** Hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation are the six priority public uses of the Refuge System, and have been determined to be compatible activities on many refuges nationwide. The Improvement Act instructs refuge managers to seek ways to accommodate those six uses. Bicycling is allowed as a means to facilitate these priority public uses on Sam D. Hamilton Noxubee NWR. Bicycling activities will not materially interfere with or detract from the mission of the Refuge System or the purposes for which the refuge was established. Bicycling will not pose significant adverse effects on refuge resources; interfere with public use of the refuge; nor cause an undue administrative burden.

This activity will not materially interfere with, or detract from, the mission of the Refuge System or purposes for which the refuge was established. In addition, this activity will fulfill one or more purposes of the refuge or Refuge System.

**NEPA Compliance for Refuge Use Description:** *Place an X in appropriate space.*

- Categorical Exclusion without Environmental Action Statement  
 Categorical Exclusion and Environmental Action Statement  
 Environmental Assessment and Finding of No Significant Impact  
 Environmental Impact Statement and Record of Decision

**Mandatory 10-year Re-evaluation Date: 2025**

---

**Use:** Boating for Wildlife-Dependent Activities

**Description of Use:** Motorized and non-motorized boating as a lone activity is not a priority public use of the Refuge System under the Improvement Act. However, this use may provide transport for wildlife observation, wildlife photography, hunting, and fishing. Motorized and non-motorized boating will be conducted on all open waters including lakes and rivers within Sam D. Hamilton Noxubee NWR. One motorized boat access ramp will be available at Bluff Lake, Loakfoma Lake, and Ross Branch Reservoir. An additional non-motorized boat launch site will be available near Cypress Cove Boardwalk on Bluff Lake.

**Availability of Resources:** Estimated costs associated with this use include:

Routine maintenance: \$35,000 annually; this is the expected cost to maintain the three public motorized boat launches and one non-motorized boat ramp and includes repairs to the ramps base material, vegetation control, maintenance of parking areas and regulator signs, removal of garbage; and maintenance of a restroom facility.

Supplies and materials: \$3,000; this includes signs for closed launch sites, site closure signs, interpretive brochures, regulation brochures.

Monitoring: \$3,000 annually, to be carried out in cooperation with the state and partners.

Law Enforcement: \$3,000 annually.

---

**Anticipated Impacts of the Use:** Potential impacts of motorized and non-motorized boating:

- Accidental introduction of invasive plants, pathogens, or exotic invertebrates, attached to boats.
- Disturbance of wildlife (particularly waterfowl, eagles, and wading birds): Popular public use boating seasons in Mississippi coincide in part with spring-early summer nesting and brood-rearing periods for many species of aquatic-dependent birds. Boaters may disturb nesting birds by approaching too closely to nests, causing nesting birds to flush. Flushing may expose eggs to predation or cooling, resulting in egg mortality.
- Negative impacts on water quality from motorboat and other pollutants, human waste, and litter: Extensive water quality testing on the refuge has not been conducted. The levels of pollutants from boat fuel and impacts on local aquatic systems are unknown. Hydrocarbon contamination can be harmful to fish.
- Bank and trail erosion from human activity (boat landings, boat wakes, foot traffic) may increase aquatic sediment loads of streams and rivers or alter riparian or lakeshore habitat or vegetation in ways harmful to fish or other wildlife.

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

- Use is Not Compatible  
 Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** Use of motorized and non-motorized boats is considered acceptable for transportation as part of hunting, fishing, wildlife observation, and wildlife photography. The refuge will permit boat launching only at designated launches to prevent the erosion and degradation of wetlands or water quality and ensure public safety. Launching of trailer boats will not be allowed in areas without a designated developed launch.

The refuge will close wildlife nesting and brood-rearing areas seasonally to all boating activities, to prevent the disturbance of wildlife.

Boat launches will be constructed and situated in such a way as to provide for public safety and minimize the disturbance of wildlife and habitat or the effects of siltation.

---

The refuge will increase public outreach and education to minimize conflicts among user groups, help control aquatic invasive plants and lead in the environment, reduce the introduction of nonnative fish species, and minimize the disturbance of wildlife and habitat.

A refuge officer will help to promote compliance with refuge regulations, monitor public use patterns and public safety, and document visitor interactions.

Motorized and non-motorized boating will be allowed as a means to facilitate refuge public use programs, namely the priority public use programs of hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation. The use will be conducted consistent with refuge and State of Mississippi regulations, with some additional restrictions to protect fish, wildlife and habitat, and reduce potential conflicts among public uses.

All waters within the entire refuge will be considered a no wake area.

The public must inspect all boats and boat trailers and clean them of aquatic invasive species before launching and leaving refuge sites. Cleaning of boats should take place on dry ground well away from the water. Exotic, nuisance plants or animals on boats, trailers, diving equipment, or in bait buckets can disrupt aquatic ecosystems and negatively affect native fish and plant species.

Regulatory signs along with educational materials will be made available in high use areas.

**Justification:** Hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation are the six priority public uses of the Refuge System, and have been determined to be compatible activities on many refuges nationwide. The Improvement Act instructs refuge managers to seek ways to accommodate those six uses. Motorized and non-motorized boating is allowed as a means to facilitate these priority public uses on Sam D. Hamilton Noxubee NWR. Boating activities will not materially interfere with or detract from the mission of the Refuge System or the purposes for which the refuge was established. Motorized and non-motorized boating will not pose significant adverse effects on refuge resources; interfere with public use of the refuge; nor cause an undue administrative burden. In addition, this activity will fulfill one or more purposes of the refuge or Refuge System.

**NEPA Compliance for Refuge Use Description:** *Place an X in appropriate space.*

- Categorical Exclusion without Environmental Action Statement  
 Categorical Exclusion and Environmental Action Statement  
 Environmental Assessment and Finding of No Significant Impact  
 Environmental Impact Statement and Record of Decision

**Mandatory 10-year Re-evaluation Date: 2025**

---

**Use:** Commercial Forest Management Operations

---

**Description of Use:** Commercial forest management operations are used to conduct timber thinning, regeneration of timber stands, treatment of pine beetle outbreaks, and other silvicultural practices used to improve forest habitat conditions. These operations are not priority public uses of the Refuge System under the Improvement Act of 1997, but instead are management activities.

Commercial forest management operations, including when necessary, the use of commercial silvicultural contractors and techniques, including the use of pesticides to control exotic and nuisance plant species, will contribute to the purposes for which the Sam D. Hamilton Noxubee NWR was established, the mission of the Refuge System, the enhancement of biological integrity, diversity, and environmental health and to facilitate the ability of the refuge to meet its habitat and wildlife management objectives.

The refuge has primarily forested habitat, being approximately 45,000 acres of forest on about 48,000 acres of land owned by the Service. The Comprehensive Conservation Plan details the concepts and specifics of desired future conditions of the forest to provide enhanced habitat for federally listed species and priority trust species.

To achieve goals over the next 15 years, manipulation through commercial forestry is essential. The refuge does not have the required staffing, equipment, and expertise to harvest timber on a large scale. Commercial forestry operations will be allowed to cut and remove timber from the refuge and sell the removed wood to commercial buyers (mills) and operators (loggers) that will pay market value for portions of the trees removed. All commercial activities occurring on the refuge require the business to obtain a special use permit. Work conducted under the authority of this permit will be closely monitored by the refuge manager or his designee. Revenue generated by the sale of refuge wood products will contribute to the Refuge Revenue Sharing fund that provides payments to the counties in lieu of property taxes.

**Availability of Resources:** The components needed to manage the process are already in place, such as salary and positions of the refuge, including the forester and forestry technicians. The project leader provides administrative oversight of the program and the administrative officer tracks and monitors the financial payments. The refuge's wildlife biologist is responsible for assessing impact to wildlife. Some amount of time is required by other positions including maintenance workers. The refuge does receive a limited amount of expense for sales funds that are used toward forestry-related operations.

**Anticipated Impacts of the Use:** The operation of heavy equipment for forest management over refuge roads and through natural habitats has the potential to impact soils, cause severe rutting, result in increased site erosion, or degrade nearby wetlands or water resources. Therefore, all commercial forest management actions will be mitigated by following forestry management procedures described in Mississippi's Forestry Best Management Practices Manual (2006).

Heavy equipment use required for timber harvesting operations also has the potential to result in localized impacts to vegetation and wildlife. Damage or destruction of understory vegetation, including rare plants and unique botanical communities, is of concern. These impacts can be prevented through careful management of stream-side management zones and use of exclusion zones.

---

Whole tree harvesting can result in a reduction of downed wood and snags in a forest ecosystem. Skidding operations can cause residual damage to trees remaining in the stand that can result in the introduction of disease and insects into an otherwise healthy forest. Harvesting trees may also leave the remaining trees more susceptible to wind throw, altering plant and animal communities, facilitating the spread of invasive plants, disturbing wildlife temporarily, or displacing it over the long term. Forest prescriptions are designed to minimize these impacts.

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

- Use is Not Compatible  
 Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** Close inspection and supervision of all timber operations are necessary to ensure that harvesting operations meet the special conditions of the special use permit and produce the outcome needed to meet refuge goals and objectives. The refuge's forester will inspect the treatment site and assess effectiveness of the treatment.

The following special conditions are included in the bid invitation and permits for all commercial forestry activities to further protect the resources of the refuge. These conditions may be modified at any time to provide better guidance to operators and protection of refuge resources.

1. A pre-entry conference with permittee and his loggers will be held prior to any work being done on the sale area or haul roads associated with the sale area. A pre-entry meeting will be held before initiation of activity within each compartment and stand prior to start of any work. The refuge manager or his representative retains authority to stop logging operations at any time if road, weather, water, or other unsatisfactory conditions exist.
2. The permittee will maintain any refuge road, right-of-way, or easements. The permittee will repair any damages to the haul roads, primary gravel roads or paved roads resulting from logging operations to standards existing prior to timber harvest activities. Repair and maintenance work may include, but is not limited to, grading, graveling, or rocking. Cost to repairs or replacements of damaged culverts or other infrastructure caused by logging equipment will be the sole responsibility of the permittee. When applicable, reasonable actual costs for work on refuge graveled roads will be refunded from performance deposits. The

---

expense of work on dirt roads within the sale area is the sole responsibility of the permittee. No new roads will be created and all access will be limited to existing roads and infrastructure.

3. The location of loading decks and logging roads will be mutually agreed to by permittee (or his representative) and refuge manager or his designee prior to their placement. All primary haul roads used by permittee will be left in good condition or blocked after operations are completed by placing logging slash and/or dirt mounds across all entrance points as directed by refuge manager or his designee. Those roads to be left open will be built up enough so that the road will not hold standing water any more than the adjacent area. This will require the use of equipment such as a bulldozer and/or road grader. If required as determined by the refuge manager or his designee, blocked roads will be re-seeded with refuge approved grasses to prevent erosion.
4. In forestry operations, no trees planned to be left (leave trees) following the operation will be cut or excessively damaged. Excessive is defined more specifically as: (1) bole damage that exposes cambium more than 6 inches (in any dimension); and (2) crown damage of 1/3 or more of the crown. As determined by the refuge manager or his designee, penalties may be assessed for cutting or damaging leave trees at a rate of three (3) times the stumpage paid for the harvested merchantable timber.
5. Trees shall be cut so as to leave a stump not less than 4 inches high and no more than 12 inches high on the side adjacent to the highest ground. Ground level paint spot must be visible after the tree has been cut.
6. Skid trails with turn trees should be planned to prevent the damage to leave trees. Turn trees shall consist of trees being harvested and should be removed only after use of skid trails ends.
7. All logging operations shall be conducted during daylight hours.
8. Trees and tops cut shall not be left hanging or supported by any other living or dead tree or brush and shall be pulled down immediately after falling.
9. Tops and logging debris shall be kept pulled back 50 feet from highways, county roads, refuge roads, and trees with basal cavities. All openings and fields must be kept clear of tops and debris. The permittee and his employees will do all within their power to prevent and suppress fires; shall pay the Federal Government for any unnecessary damage to roads, fields, openings, and ditches resulting from operations.
10. Logging operations will be allowed only when site conditions allow. Logging will not be allowed when ground is wet and subject to rutting or severe soil compaction. At no time will rutting deeper than 6" be allowed.
11. The refuge manager or his designee shall have the authority to temporarily close down all or any part of the operation during a period of high fire danger, inclement weather, refuge hunts, safety reasons, or any other reason deemed necessary. Extensions to the special use permit time period equal to the closed period will be granted to the permittee. Extensions will not be granted due to inactivity during favorable harvesting conditions.
12. Logging operations will not be allowed in a stand containing red-cockaded woodpecker cluster sites during the breeding season, usually April 1 to June 30.

- 
13. The permittee (or his representative) will not litter. Disposal of petroleum products onsite is prohibited. Equipment must be maintained and not leak more than a few drops of petroleum product per day. Performance bond monies may be used to pay for litter clean-up.
  14. Tree-length logging and skidders will be allowed. Unnecessary damage to the residual stand will not be tolerated. As determined by the refuge manager or his designee, penalties may be assessed for damage to unmarked trees at a rate of three (3) times the stumpage paid for the harvested merchantable timber.
  15. If spacing between trees does not allow cutter head grapples to be used without damage to leave trees, alternative harvest methods should be used.
  16. Sufficient cut trees, trees that are to be removed as part of the operation, should be left along the skid trails and deck to prevent skidder damage to leave trees and these cut trees should be the last trees removed as part of the operation.
  17. Each portion of the sale area must be completed before moving to other portions of the area unless authorized by the refuge manager.
  18. The permittee will be responsible for job safety while operating on the refuge.
  19. The possession and/or use of firearms and alcohol on the refuge are prohibited.
  20. All of the best management practices for forestry in Mississippi will be followed as mandatory practices. Failure to follow these practices is grounds for termination of the special use permit.
  21. Logging decks must not be located within 200 feet of active or inactive red-cockaded woodpecker cavity trees.
  22. Logging roads and trails shall not be established through red-cockaded woodpecker clusters.
  23. When working immediately adjacent (<300 feet) to active red-cockaded woodpecker clusters, no activity will occur prior to 8 a.m. or after 4 p.m.
  24. Trees being removed from areas adjacent to red-cockaded woodpecker clusters should be cut to fall away from the cluster to prevent damage to cluster trees.

**Justification:** Commercial forest management, to include such actions as commercial timber thinning, salvage, and other silvicultural practices, is used to improve forest habitat conditions. Commercial forest management allows the refuge to maintain and enhance necessary habitat for wildlife, including threatened and endangered species by promoting plant communities beneficial to these species. Additionally, use of commercial foresters can protect forest health during time requiring emergency forest actions to prevent unwanted spread of insect or disease outbreaks.

---

The primary goal of active forest management on the refuge will be to enhance and maintain habitat for species identified as resources of concern and associated habitat communities identified in the comprehensive conservation plan. Commercial forest management operations, including when necessary the use of commercial silvicultural contractors and techniques, will contribute to the purposes for which the refuge was established, the mission of the Refuge System, and the enhancement of biological integrity, diversity, and environmental health. These management operations will also facilitate the ability of the refuge to meet its habitat and wildlife objectives.

Commercial forest management operations will not materially interfere with, or detract from, the mission of the Refuge System or the purpose for which the refuge was established.

**NEPA Compliance for Refuge Use Description:** *Place an X in appropriate space.*

- Categorical Exclusion and Environmental Action Statement
- Environmental Assessment and Finding of No Significant Impact
- Environmental Impact Statement and Record of Decision

**Mandatory 10-year Re-evaluation Date: 2025**

---

**Use:** Commercial Wildlife and Nature Photography and Filming

**Description of Use:** The use is commercial photography, either still or motion pictures, of wildlife, or nature scenes for conservation uses. This is not a priority public use, but will contribute to priority public uses.

This use typically involves creating a documentary film, taking still photographs, or recording wildlife sounds that are intended to be or could be sold for income or revenue or traded for goods or services. Commercial recording of natural, historical, or cultural subjects is covered under this compatibility determination. This compatibility determination does not apply to legitimate news media activities.

Each request for this use will be considered, and if appropriate, will be issued a special use permit by the refuge manager. Each request must be presented in writing with details of who, what, where, when, why, and how the commercial operation will be conducted. Each request will be evaluated on its own merit. The refuge manager will use professional judgment in ensuring that the request will have no considerable negative impacts to natural, cultural, or visitor services; will not violate refuge regulations; and that it will contribute to the achievement of the refuge purpose or the Refuge System mission. Special needs will be considered on a case-by-case basis and are subject to the refuge manager's approval. Any approved special use permit will outline the framework in which the use can be conducted, and refuge staff will ensure compliance with the permit.

Commercial photography is a popular enterprise on the refuge due to the scenic natural habitats and abundant wildlife in the area. The refuge staff anticipates that an increase in commercial photography will occur over the next few years as the refuge gains visibility and areas of natural habitat in the surrounding area decrease.

---

**Availability of Resources:** Permitting this use is within the resources available to administer the refuge's Visitor Services Program. Additional staff costs are incurred to review each request, analyze affected habitats and wildlife, coordinate with the outside entity, and process a special use permit, if necessary. Compliance with the terms of the permit is within the regular duties of the refuge's law enforcement officer. Anticipated costs for up to five requests are as follows:

- Refuge Biologist (GS-11) (review request and issue special use permit) – 1 day/yr = \$476
- Visitor Services Manager (GS-09) (review requests, coordinate with entity, process special use permit) – 3 days/yr = \$589
- Refuge Manager (GS-12) (review and approval) – 1 day/yr = \$285
- Law Enforcement Officer (GS-09) (enforcement patrols) – 1 day/yr = \$196

**Anticipated Impacts of the Use:** Commercial photography can result in positive or negative impacts to the wildlife resource. Visitors engaging in commercial photography are expected to use and stay on established trails or roads to access the interior of the refuge. To minimize disturbance to natural resources and ensure public safety, the refuge has implemented restrictions on public entry such as closed areas, seasonally restricted areas, and daily hour restrictions. Facilities most utilized by refuge visitors engaging in commercial photography are roads, parking lots, trails, and boat launching ramps. Maintenance or improvement of these facilities will cause negligible to short-term minor impacts to localized soils and waters and may cause some wildlife disturbances and damage to vegetation.

Commercial wildlife and nature photography is expected to have negligible short-term, long-term, or cumulative impacts on the economy of the towns or county in which the refuge lies based on findings regarding socioeconomic impacts. We do not expect this activity to considerably alter the demographic or economic characteristics of the local community. All refuge actions will neither disproportionately affect any communities nor damage or undermine any businesses or community organizations. No adverse impacts are foreseen to be associated with changes in the community character or demographic composition.

Commercial filming, as with other uses, has the potential to disrupt cultural resources. Refuge visitors may inadvertently or even intentionally damage or disturb known or undiscovered cultural artifacts or historic properties. Impacts are expected to be negligible based on our observations of past visitor impacts from these uses.

A Section 7 evaluation has been conducted as part of this review to address the endangered red-cockaded woodpecker and bald eagle. It was determined that proposed activities would not likely affect the red-cockaded woodpecker. Areas near active bald eagle nests will not be open at any time for commercial photography and, therefore, are not expected to have any negative impacts on bald eagles (USFWS 2007).

Commercial photography is expected to have negligible adverse short-term, long-term, or cumulative impacts on secretive marsh birds, waterbirds, and waterfowl. With the addition of new trails, commercial photography has the potential to increase disturbance to waterfowl, secretive marsh birds, and waterbirds. However, a majority of the photography takes place along the Bluff Lake Road, minimizing the impact to refuge habitats. To minimize waterfowl disturbance from this use, the refuge has designated approximately 200 acres as waterfowl sanctuaries that will be closed on a seasonal or annual basis.

Negligible adverse short-term, long-term, or cumulative impacts on landbirds are expected.

---

Impacts to fisheries from visitors engaged in commercial photography are expected to be temporary and minor. Use of boats and canoes will cause increased suspension of bottom sediments, which should not adversely affect biological oxygen demand for fisheries resources. Boat motors may also harm submerged or emergent vegetation, which may cause a negligible negative impact to protective cover for fisheries. Accidental introduction of invasive plants, pathogens, or exotic invertebrates attached to boats or canoes is a concern.

Commercial photography is expected to have negligible adverse short-term, long-term, or cumulative impacts on mammals. While developing this compatibility determination, we evaluated the use for its potential to benefit or adversely affect amphibians and reptiles or their habitats used for mating, reproduction, over-wintering, and foraging.

Impacts to invertebrates such as butterflies, moths, other insects, and spiders are expected to be negligible. Visitors participating in commercial photography are restricted to designated trail routes and interior roads, which minimizes disturbance to invertebrates.

Opportunities for commercial photography are available via new trails using existing and already maintained trail/road networks from one hour before sunrise to one hour after sunset. Using existing roads will minimize impacts to refuge resources. Moderate beneficial impacts are expected by providing additional opportunities and general appreciation of nature. Some conflict between refuge users is expected to result in short-term moderate adverse impacts, which will be managed through seasonal closures. These seasonal closures are highlighted below and apply mostly to non-consumptive users during the hunting season. Other seasonal closures are in place to minimize wildlife disturbance.

- (a) Jones Creek Unit near Ross Branch Reservoir is closed year-round to all public entry
- (b) Mobility Impaired Hunting Area during hunting seasons
- (c) Eagle Nesting Areas in accordance with Service guidelines

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

- Use is Not Compatible  
 Use is Compatible with the Following Stipulations

---

**Stipulations Necessary to Ensure Compatibility:** Each request must comply with 43 CFR Part 5, Public Law 106-206 (May 2000), and 8 RM 16 (Refuge Manual). To ensure compatibility with the Refuge System and refuge goals and objectives and to minimize or exclude adverse impacts as described above, the activity will be subject to the following stipulations:

1. Only commercial photography in support of conservation, refuge purposes, the Refuge System mission, or for education and interpretive purposes will be permitted. Small scale wedding photography will be allowed.
2. Permittee shall provide a detailed description of photography and filming plans, including site specific location, support equipment, number of persons involved, client name, story board describing themes and key messaging, and other details that would allow for evaluation of the project.
3. Permittee(s), designated representative, and associates will comply with all refuge regulations and conditions of the special use permit as provided by the refuge manager. The special use permit will detail who, what, where, when, why, and how the commercial operation will be conducted.
4. Alterations to any vegetation are prohibited.
5. Permittee will be required to minimize potential impacts to refuge visitors and natural and/or cultural resources within the refuge.
6. Permittee is responsible for acquiring and/or renewing any necessary state and federal permits prior to beginning or continuing project.
7. The refuge manager or designee can suspend the project, modify conditions, and/or terminate the project that is already permitted and in progress should unacceptable, unforeseen, or unexpected impacts or issues arise or be noted.
8. Proper credit should be given to the refuge and the Service for all commercial filming, including commercial recordings of images and sounds collected on the refuge.
9. Permittee will clean up all sites of trash and litter to the satisfaction of the refuge manager.
10. Permittee will provide the Service with at least one free copy of all commercial products generated on the refuge.
11. Permittee will not capture or retain wildlife without specific written permission from the Service, as well as having all required permits.

The refuge shall also collect any costs incurred by the refuge as a result of photography activities, including but not limited to administrative, security and personnel costs. All costs recovered shall be in addition to any use fee. Public Law 106-206 states that fees for commercial photography must be based on several criteria, including:

- The number of days the commercial photography or still photography takes place on federal land (\$50 per day);

- 
- The size of the film crew present on federal land (No charge 0-2 persons and \$25 per person per day for 3 or more persons; and
  - The amount and type of equipment present on federal land (No charge for handheld equipment only and for non-handheld equipment the fee will be 1 percent of equipment value per day).

**Justification:** Commercial photography has the potential to inspire and educate the public about the Refuge System, natural habitats, and wildlife. Wildlife photography is a priority wildlife-dependent use of the Refuge System through which the public can develop an appreciation for fish and wildlife. The Service's policy is to provide expanded opportunities for wildlife-dependent uses when compatible and consistent with sound fish and wildlife management, ensuring that they receive enhanced attention during planning and management.

Specific refuge regulations address equity and quality of opportunities for visitors and help safeguard refuge habitats. Impacts from this proposal, short-term and long-term, direct, indirect, and cumulative, are expected to be minor and are not expected to diminish the value of the refuge for its stated objectives.

The stipulations listed above will ensure proper control of the use and provide management flexibility should detrimental impacts develop. Allowing this use also furthers the mission of the Refuge System by providing renewable resources for the benefit of the American public while conserving fish, wildlife, and plant resources on the refuge.

Commercial photography is considered an economic use of a national wildlife refuge and is guided by the following policies:

**16 U.S.C. 668dd, 50 CFR 27.71, Motion or Sound Pictures**

The taking or filming of any motion or sound pictures on a national wildlife refuge for subsequent commercial use is prohibited except as may be authorized under the provisions of 43 CFR 5.

**16 U.S.C. 668dd, 50 CFR 27.97, Private Operations**

Soliciting business or conducting a commercial enterprise on any national wildlife refuge is prohibited except as may be authorized by special permit.

**16 U.S.C. 668dd, 50 CFR 27.86, Begging**

Begging on any national wildlife refuge is prohibited. Soliciting of funds for the support or assistance of any cause or organization is also prohibited unless properly authorized.

**16 U.S.C. 668dd, 50 CFR, Subpart A, 29.1, Allowing Economic Uses on National Wildlife Refuges**

We may only authorize public or private economic use of the natural resources of any national wildlife refuge, in accordance with 16 U.S.C. 715, where we determine that the use contributes to the achievement of the national wildlife refuge purposes or the Refuge System mission.

**8 RM 16, Audio Visual Productions**

**5 RM 17, Commercial and Economic Uses on National Wildlife Refuges**

---

43 CFR Part 5, Making Pictures, Television Productions, or Sound Tracks on Certain Areas Under the Jurisdiction of the Department of the Interior

Public Law 106-206, Commercial Filming

Commercial photography and/or filming have the potential to inspire and educate the public about the Refuge System, natural habitats, and wildlife. These activities will not materially interfere with, or detract from, the mission of the Refuge System or purposes for which the refuge was established. In addition, these activities will fulfill one or more purposes of the refuge or the Refuge System. Commercial photography and/or filming are appropriate uses of the refuge with special conditions. A special use permit will be issued for each commercial operation and special conditions will be determined on an individual bases. In addition, this activity will fulfill one or more purposes of the refuge or Refuge System.

**NEPA Compliance for Refuge Use Description:** *Place an X in appropriate space.*

- Categorical Exclusion without Environmental Action Statement
- Categorical Exclusion and Environmental Action Statement
- Environmental Assessment and Finding of No Significant Impact
- Environmental Impact Statement and Record of Decision

**Mandatory 10-year Re-evaluation Date: 2025**

---

**Use:** Commercially Guided Wildlife and Nature Observation

**Description of Use:** The refuge will authorize commercially guided wildlife observation within the refuge and will regulate such use through the implementation of a commercial wildlife guide management program, including issuance of special use permits with conditions. Commercial means that clients pay a fee for the program and the intent of the permittee is to generate profit. Guiding also includes outfitting operations which may not provide an accompanying guide. Guiding does not include no-fee or not-for-profit guided tours conducted by non-profit groups, schools and colleges, or other agencies. This use is covered under the general wildlife observation compatibility determination.

This use also does not include tour bus or other road-based commercial tours which may stop at refuge administered overlooks or landings.

This activity provides recreational, and often educational, opportunities for the paying public who desire a successful, quality experience, but who may lack the necessary equipment, skills, or knowledge to observe wildlife or otherwise experience the refuge. Commercial guiding for wildlife or other observation is an existing activity on the refuge, but it has not been consistently administered. This use is not a priority public use but will contribute to priority public uses.

---

Each request for this use will be considered, and if appropriate, will be issued a special use permit by the refuge manager. Each request must be presented in writing with details of who, what, where, when, why, and how the commercial operation will be conducted. Each request will be evaluated on its own merit. The refuge manager will use professional judgment and ensure that the request will have no considerable negative impacts to natural, cultural, or visitor services, does not violate refuge regulations, and contributes to the achievement of the refuge purpose or the Refuge System mission. Special needs will be considered on a case-by-case basis and are subject to the refuge manager's approval. Any approved special use permit will outline the framework in which the use can be conducted and refuge staff will ensure compliance with the permit.

The use will be conducted within the refuge's boundary. While the refuge will be open to these uses, the majority of the public use infrastructure is located near the refuge headquarters. Currently, 7 miles of hiking trails, 3 observation towers, 2 boardwalks, informational kiosks, 2 boat ramps, and a visitor center are located near the refuge headquarters.

Opportunities for commercially guided wildlife observation is available via existing trails, already maintained trail/road networks, existing boardwalks, and existing observation tower around the lakes from one hour before sunrise to one hour after sunset. Using existing roads will minimize impacts to refuge resources. Moderate beneficial impacts are expected. Some conflict between refuge users is expected to result in short-term moderate adverse impacts, which will be managed through seasonal closures. These seasonal closures are highlighted below and apply mostly to nonconsumptive uses during the hunting season. Other seasonal closures are in place to minimize wildlife disturbance.

- (a) Jones Creek Unit near Ross Branch Reservoir is closed year-round to all public entry
- (b) Mobility Impaired Hunting Area during hunting seasons
- (c) Eagle Nesting Areas in accordance with Service guidelines

Guided wildlife observation may involve the use of refuge boat ramps to access selected sites or routes. Often guides and clients use the same site, route, or one of several locations selected by the guide. Some guided programs may walk to sites/routes from parking lots or roadsides. Guided wildlife viewing operations have typically used existing refuge or other public observation sites. In addition to the observation activities, guides and clients may use refuge facilities for breaks, lunch, or other activities during the outing, and in accordance with refuge regulations.

The total number of wildlife observation guides and clients on the refuge is not known. A first step in establishing a commercial guiding program on the refuge will be to identify existing guides and outfitting businesses through a review of public records and outreach through news releases and special meetings. Until further information becomes available, the refuge manager will annually permit a maximum of three guides for each of the following uses: (1) commercially guided tours for canoeing/kayaking/boats (use of water trails); (2) commercially guided tours for birding or nature (use of upland trails); and (3) guided tours for continuing education. Organizations whose purpose supports refuge goals and objectives will also be able to use the refuge auditorium for meetings and workshops.

Administration of commercially guided wildlife activities will be conducted in accordance with commercial guide use stipulations developed to ensure consistency throughout the refuge; provide a safe, quality experience; protect resources; and to ensure compliance with pertinent Refuge System regulations and policies.

---

The guide use stipulations will address all aspects of the guided wildlife observation program, including the number of permits to be issued, guide qualifications, permit cost, and selection methods. Commercial Guide Use Areas will be established based on factors such as habitat and wildlife sensitivity, other refuge resources and users, and other pertinent issues.

Wildlife observation is a compatible educational and recreational opportunities for visitors to enjoy the resource and to gain understanding and appreciation for fish and wildlife, wild lands ecology and the relationships of plant and animal populations within the ecosystem, and wildlife management. Based on apparent existing client demand, a significant number of the public are willing to pay for the additional expertise and local knowledge provided by commercial businesses and guides. The refuge provides excellent populations of watchable wildlife in a wild and scenic setting. It is expected that demand for guided wildlife observation will continue to increase, and with it, the number of interested commercial operators.

**Availability of Resources:** This program will increase overall costs of refuge operations, including but not limited to, development and review of policy and procedure, yearly administration of permits (inquiries, screening and selecting applicants, issuing permits), and enforcement of permit conditions. In the short-term, existing staff is adequate if shifts in priorities and assignments are made to accommodate a modest guiding program. However, the size and scope of the guiding program, and the number of permits that will be available, will have to be limited in balance with permit fees received. In the long-term, a comprehensive guiding program, when combined with other new initiatives requiring permits, will require additional administrative and/or other personnel as identified in the comprehensive conservation plan. Existing facilities (launch ramps) and other infrastructure are currently sufficient to accommodate this use.

Permitting this use is within the resources available to administer our Visitor Services Program. Additional staff costs are incurred to review each request, coordinate with the outside entity and process a special use permit, if necessary. Compliance with the terms of the special use permit is within the regular duties of the refuge's law enforcement officer. Anticipated costs are as follows: \$2000.

**Anticipated Impacts of the Use:** Commercially guided wildlife observation can result in positive or negative impacts to the wildlife resource. A positive effect of allowing visitor's access to the refuge will be the provision of additional wildlife-dependent recreational opportunities and a better appreciation and more complete understanding of the wildlife and habitats associated with the ecosystem. Each application will be evaluated on its own merit and stipulations will be adapted to individual requests to minimize impacts to vegetation and wildlife and ensure that the use is consistent with goals of the refuge and the Refuge System.

Visitors engaging in commercially guided activities are expected to use and stay on hiking and canoe trails or roads to access the interior of the refuge. Disturbance of refuge resources is the primary concern regarding commercially guided activities for wildlife observation. While field trip routes and observation sites are usually located in areas open to the public, disturbance caused by large groups could be more intense because the number of people, and desire to get close to wildlife, may be greater than what normally occurs during general public activities. This disturbance will displace individual animals to adjacent areas of the refuge. Commercially or recreationally, groups of 6 or more cyclists or groups of 15 or more pedestrian travelers will require a special use permit.

---

Facilities most utilized by refuge visitors engaging in commercially guided wildlife observation are roads, parking lots, trails, and boat launching ramps. Maintenance or improvement of these facilities will cause negligible short-term impacts to localized soils and waters and may cause some wildlife disturbances and damage to vegetation. Impacts from the construction of expanded facilities for visitor services programs that will accommodate commercially guided activities are expected to be negligible.

Commercially guided wildlife observation is expected to have negligible short-term, long-term, or cumulative impacts on the economy of the towns or county in which the refuge lies based on findings of economic activity. No adverse impacts are foreseen to be associated with changes in the community character or demographic composition.

This activity will result in several minor beneficial impacts on the social communities near the refuge and in the state and region as a whole. In the case of commercial guiding, additional economic benefit will be gained by any local businesses providing guided wildlife observation opportunities.

Commercially guided wildlife observation is expected to have negligible adverse short-term, long-term, or cumulative impacts on local or regional air and water quality. Localized increases in emissions from visitor's vehicles or boat motors will be negligible. The use of boats by these visitors has the potential to affect water quality negatively by increasing erosion, stirring up bottom sediments, or introducing pollutants into waterways. We do not expect emissions from vehicles or boat motors to substantially affect the water quality of the region due to the low level of use authorized.

Commercially guided wildlife observation is expected to have negligible adverse short-term, long-term, or cumulative impacts on soils and vegetation. Negligible disturbance to vegetation will occur during the construction of new trails, boardwalks, observation towers, and informational kiosks in the "Connecting People to Nature" Area to facilitate wildlife observation/photography activities due to the utilization of existing interior roads and access routes. Disturbance factors resulting from public use are always considered for all listed species. The red-cockaded woodpecker is listed as endangered by the Service and Bald eagles occur on the refuge and areas near active nests will not be open at any time for commercially guided wildlife observation and, therefore, are not expected to have any negative impacts (USFWS 2007).

Many of the impacts described for waterfowl, shorebirds, and secretive marsh and waterbirds are similar.

Commercially guided wildlife observation is expected to have negligible adverse short-term, long-term, or cumulative impacts on waterfowl. To minimize waterfowl disturbance from this use, the refuge has designated approximately 2,000 acres as waterfowl sanctuaries that will be closed on a seasonal or annual basis. This use is expected to have negligible adverse short-term, long-term, or cumulative impacts on secretive marsh and waterbirds, shorebirds, and landbirds. An increase in the number of hiking trails, particularly in or near wetland areas, has the potential to increase disturbance to secretive marsh and waterbirds, but the expectation is that impacts will be negligible for all of these species.

---

Impacts to fisheries from visitors engaged in commercially guided wildlife observation is expected to be temporary and minor. Use of boats and canoes will cause increased suspension of bottom sediments, which should not adversely affect biological oxygen demand for fisheries resources. Boat motors may also harm submerged or emergent vegetation, which may cause a negligible negative impact to protective cover for fisheries. Accidental introduction of invasive plants, pathogens, or exotic invertebrates attached to boats or canoes is a concern, but the expectation is that impacts will be negligible.

Commercially guided wildlife observation is expected to have negligible adverse short-term, long-term, or cumulative impacts on invertebrates and mammals. An increase in indirect impacts to mammals due to expansions such as new trails is also expected. The use was evaluated for its potential to benefit or adversely affect amphibians and reptiles or their habitats used for mating, reproduction, over-wintering, and foraging.

Guided tour activities may conflict with other refuge users, including commercial or non-commercial tours that will likely use the same areas as independent wildlife viewers, kayakers and canoeists, and hunters and anglers during open seasons. Unregulated or inadequately regulated commercial guiding operations may adversely affect the safety of other refuge users, the quality of their experience, and the equity of opportunity. The refuge's visitor use programs will be adjusted as needed to eliminate or minimize each conflict and provide quality wildlife-dependent recreational opportunities.

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

- Use is Not Compatible  
 Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** The following stipulations apply to the special use permits issued for commercial guided recreational tours. Law enforcement and administrative monitoring of permit holders will continue for compliance with the following conditions, which are incorporated into all permits to minimize impacts on refuge lands and resources:

1. Impacts of the commercial guiding for wildlife observation will continue to be assessed and adjustments made to the program to prevent conflicts to wildlife, habitats, and other refuge users.

- 
2. Qualified individuals must apply 12 months in advance to conduct guided tours. Qualified individuals are defined as:
    - a. Licensed as a commercial guide by the state in which they operate, as applicable and must also be certified by applicable associations such as the American Canoeing Association (<http://www.americancanoe.org/>) or similar certification if available.
    - b. When operating a boat, possess a current vessel operator license issued by the U.S. Coast Guard, as applicable. Minimum license shall be Operator Uninspected Passenger Vessel. The license shall be valid for the area of operations and type(s) of vessel operated. This license applies to guides transporting patrons by water.
    - c. Possess and provide proof of a current CPR and First Aid training certificate issued by a recognized national organization.
    - d. Provide proof of insurance, including minimum coverage for general liability and comprehensive for all operations.
    - e. Certified as a "Certified Interpretive Guide" through the National Association for Interpretation (<http://www.interpnet.com>) and certified annually by the refuge manager through an orientation of current refuge news and information.
  3. Administrative fee will be \$100 yearly. In addition to the administrative fee, the permit fee will be 5 percent of gross revenues or \$50, whichever is greater.
  4. The permittee will not advertise on refuge property or distribute leaflets via the refuge visitor contact station, refuge headquarters, etc. Permittees may distribute leaflets only during the approved programs covered by the permit and only to those participants registered for that program.
  5. All special use permits will expire on September 30, regardless of the date of issue. The permittee is responsible for accurate record-keeping and shall provide the refuge manager with the following information by October 10 of each year:
    - a. Fee schedule for the year (charge per patron)
    - b. Number of guided or outfitted trips performed on the refuge
    - c. Number of individuals guided or outfitted
    - d. Date of each trip
    - e. Location of each trip, or general area of activity
    - f. Individual names and description of duties for all additional staff that assist with a trip on the refuge.
  6. A copy of a valid special use permit must be available for inspection on request by any law enforcement officer or refuge staff member, whenever an activity authorized by the permit is occurring. Storing permits in the glove box of a vehicle is acceptable; however, all guides must be knowledgeable about the permit and its conditions.
  7. Violation of any special conditions of the permit or of any federal, state, local, or refuge regulations may result in a Notice of Violation being issued or the revocation or

---

cancellation of the permit without written or verbal warning. In that case, the permit holder will receive immediate notification by phone, with follow-up notification by mail. The permit holders are responsible for the actions of their employees, agents, others working under their special use permit, and their clients.

8. Regardless of the reason for the revocation or cancellation of a permit, no refund will be made to the permit holder.
9. The refuge will issue permits on a year-to-year basis, and will not reissue them automatically on consecutive years.
10. Permit holders will provide all participants with relevant refuge information, including the public use brochures. The refuge will supply information to the permit holder.
11. Permittees may use assistants. These assistants must be named on the permit issued and possess any of the applicable state and Coast Guard licenses for duties conducted, as applicable. These assistants must also attend the required annual orientation by the refuge.
12. All boats must comply with U.S. Coast Guard, state and refuge requirements.
13. Tours must begin and end during daylight hours only.
14. Groups will police their routes for litter, vandalism, etc., and report any problems to the refuge office.
15. All vessels and vehicles used in guide operations shall be marked with a guide identifier.

**Justification:** Allowing commercially guided wildlife observation on the refuge will not materially interfere with the purposes of the refuge or the mission of the Refuge System because:

- (1) Existing federal and state agency oversight and regulation of affected species and habitat are sufficient to ensure healthy populations. Disturbance to fish and wildlife will be local, short-term, and not adversely impact overall populations.
- (2) There are adequate state and federal enforcement officials to enforce state and federal regulations.
- (3) Qualifying standards for commercial operators will help ensure that the public is guided by competent individuals.
- (4) Restricting the number of guides and managing how guided activities are conducted will reduce adverse habitat effects, conflicts between competing guide services, and conflicts between guided operations and other refuge users.
- (5) Designated areas of operation (Guide Use Areas), operating requirements, and other regulation of guided activities will minimize conflicts with other refuge users.

---

(6) Administrative (application) and special use fees will help off-set costs to administer and provide oversight to this use.

(7) Regulating and limiting the number of commercial operators as stated in the refuge commercial guide program stipulations will provide a safe, quality experience to individuals who want to enjoy the resources of the refuge. It will also increase opportunities for those who wish to observe wildlife and experience the scenic and wild nature of the refuge, but may lack the required equipment, knowledge, or expertise.

This activity will not materially interfere with, or detract from, the mission of the Refuge System or purposes for which the refuge was established. In addition, this activity will fulfill one or more purposes of the refuge or Refuge System.

**NEPA Compliance for Refuge Use Description:** *Place an X in appropriate space.*

**Mandatory 10-year Re-evaluation Date: 2025**

---

**Use:** Firewood Cutting for Personal Use Only

**Description of Use:** Firewood gathering is the cutting and removal of woody material for private use. Firewood gathering is offered to the public following timber stand improvements or forest thinning in small lots or areas, or at times when timber sales are not feasible. In young tree plantations, firewood gathering could be offered in lieu of a commercial timber harvest operation. It may also be permitted when trees that have fallen across roads, trails, or firebreaks must be removed.

Private individuals are permitted to remove, for personal use only, fallen timber or marked standing timber as designated by the refuge manager. The scope of the use will be determined by the management objective for the area and by the quantity and quality of available wood. Harvest sites will vary in size from a portion of an acre up to several hundred acres depending on the site and management objectives. Wood removal activities may be authorized throughout the year when ground conditions allow access without damaging refuge roads and resources.

Chainsaws and axes may be used to harvest firewood. Access may be by car and trailer or pickup truck. Differences in scope and necessary equipment will occur depending on the amount and type of wood available for removal. This activity will only occur where the Service has determined that a management need exists to remove wood.

**Availability of Resources:** Excess woody material is plentiful on the refuge. Public firewood gathering requires oversight and administration by the refuge forester, as time allows, or by other staff experienced with the program. Refuge operations and maintenance funding will be needed to cover salaries of staff members who complete paperwork and administer the program and for marking paint, flagging, vehicles, and fuel. Anticipated costs for up to five requests are as follows:

- 
- Refuge Forester (GS-11) (review request and issue special use permit) – 10 day/yr = \$4,760
  - Visitor Services Manager (GS-09) (review requests, coordinate with entity, process special use permit) 3 days/yr = \$589
  - Refuge Manager (GS-12) (review and approval) – 1 day/yr = \$285
  - Law Enforcement Officer (GS-09) (enforcement patrols) – 1 day/yr = \$196

**Anticipated Impacts of the Use:** The potential exists to directly impact wildlife by displacing animals from localized areas due to disturbance, noise, or removal of nesting areas. Due to the small scale of firewood gathering on the refuge, disturbance to wildlife will be negligible. Avoidance of nesting periods for migratory birds will reduce impacts on populations. Most impacts can easily be avoided by timing of season in accordance with site-specific characteristics.

Large, dead, and downed trees and standing snags are extremely important habitat components that should remain on the refuge unless they pose a danger to the public in concentrated use areas or to refuge operations. Unlikely incidents affecting hunters during general hunts will not be considered reason enough to remove snags. In some cases, the removal of trees along roads, trails, and dikes is necessary to reduce hazards to users caused by falling trees and limbs.

Impacts to refuge roads and trails due to soil compaction from vehicles, rutting, or root damage are possible but can be avoided by restricting use to dry ground conditions. Traffic on refuge roads will need to be carefully controlled (via special use permit) to avoid impacts such as rutting and potholes. Because few requests are received for this type of activity, halting the practice entirely should not create a problem as local residents do not generally rely upon a supply of wood for home heating. Firewood cutting benefits the public and can be used as a management tool in forested habitats and as a maintenance tool on roads, trails, and grounds. The removal of dead trees reduces litter buildup and the potential for damaging wildfires. Direct impacts on wildlife can be avoided by timing the activity so that it does not coincide with the breeding/production season. Individuals gathering firewood will be required to comply with special use permit conditions and site-specific stipulations to ensure that resources are protected and management goals are achieved.

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

Use is Not Compatible

---

Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** Firewood gathering will be regulated by special use permit so that site-specific impacts can be reduced or eliminated and Service management goals are met. The permit will include stipulations that ensure the practice is allowed only when it benefits refuge operations or habitat conditions, areas and times of use are specified, ingress and egress points controlled, trees to be removed are marked by refuge staff, allowable equipment is identified, and other important conditions are specified.

The use will be restricted to periods of dry ground conditions to avoid rutting and soil compaction on refuge roads, to the extent practicable.

Firewood cutting will be limited to weekday only to allow for oversight by the refuge's administrative forester.

Firewood removed from refuge lands is for personal use only and may not be sold.

Chainsaws and axes may be used to harvest firewood.

Access with car and trailer or truck will only occur in areas already having developed access routes. No off-road vehicle use will be allowed under this program.

This activity will only occur where the Service has determined that a management need exists to remove wood.

Gathering of downed trees for firewood will be allowed from the surface of refuge roads without a special use permit. No downed wood will be allowed to be removed from outside the road drainage ditches or the wood's interior.

**Justification:** Firewood cutting and gathering allows the refuge the option to maintain and enhance necessary habitat for threatened and endangered species. This is accomplished by promoting plant communities beneficial to these species, managing forest stands by manipulating stand composition in order to produce high-quality habitats for trust resources, and manipulating forest stands to provide diverse plant successional stages ranging from regeneration to mature timber, which will support a variety of wildlife species. Additionally, forest health can be protected by emergency forest actions to prevent unwanted spread of insect or disease outbreaks. Silvicultural decisions will be based upon the resources of concern and their habitat requirements as they relate to forest composition and structure.

This activity will not materially interfere with, or detract from, the mission of the Refuge System or purposes for which the refuge was established. In addition, this activity will fulfill one or more purposes of the refuge or Refuge System.

**NEPA Compliance for Refuge Use Description:** Place an X in appropriate space.

---

---

**Use:** Geocaching for Environmental Education

**Description of Use:** Environmental education is a priority public use as defined by the Improvement Act, and if compatible, is to receive enhanced consideration over other general public uses. Geocaching at refuge established sites can be an important tool in connecting people with nature while educating them about nature, the mission of the Service, and the purposes for which the refuge was created.

Geocaching opportunities are conducted to provide compatible educational opportunities with a recreational flare for visitors to enjoy the resource and to gain understanding and appreciation for fish and wildlife, wild lands ecology and the relationships of plant and animal populations within the ecosystem, and wildlife management. This use will provide opportunities for visitors to observe and learn about wildlife and wild lands at their own pace in an unstructured environment and to observe wildlife habitats firsthand. This use will enhance the public's understanding of natural resource management programs and ecological concepts to enable the public to better understand the problems facing our wildlife/wild lands resources, to realize what effect the public has on wildlife resources, to learn about the Service's role in conservation, to better understand the biological facts upon which Service management programs are based, and to foster an appreciation for the importance of wildlife and wild lands. It is anticipated that participation in this use will result in a more informed public, with an enhanced stewardship ethic and enhanced support and advocacy for Service programs.

This use will also provide wholesome, safe, outdoor recreation in a scenic setting, with the realization that those who come strictly for recreational enjoyment will be enticed to participate in the more educational facets of the public use program, and can then become informed advocates for the refuge and the Service.

The use will be conducted within the refuge's boundary. While the entire refuge will be open to this use, the majority of the public use infrastructure is located near the refuge headquarters. Currently, 7 miles of hiking trails, 3 observation towers, 2 boardwalks, informational kiosks, 2 boat ramps, and a visitor center are located near the refuge headquarters. Refuge created geocache sites will be conducted for the general public, as well as for organized groups, including schools and scout groups. Brochures and maps depicting the roads and trails open for public use are available at the Visitor Contact Station, kiosks, and on the refuge's web site.

Environmental education will be conducted by way of personal presentations by staff and volunteers, teachers and other youth leaders, and at special events and displays both on and off the refuge. Educational and interpretive information will be provided via signage, kiosks, printed information, exhibits, audio-visual presentations, and lecture programs as traditionally offered, and geocache stations will provide visitors with unique opportunities for education and interpretation throughout the refuge.

---

**Availability of Resources:** Allowing the use of environmental education and interpretation is within the resources available to administer our visitor services program with the current level of participation and to ensure that the use remains compatible with the refuge purposes. Additional funding for visitor services improvements can also come from challenge cost-share projects, grant funds, and contributions. Compliance with refuge regulations is handled within the regular duties of the law enforcement officer. As funding is available, the refuge will complete and maintain projects and facilities. Volunteers and partners will be utilized to help with construction and maintenance.

Facilities or materials needed to support this use include maintaining access roads, parking areas, gates, roadside pull-offs, kiosks, signs, the Visitor Contact Station, boat launching areas, and hiking trails; creating a “Connecting People with Nature” area and trail; and providing information in refuge publications and the refuge’s web site.

Sufficient staff and maintenance funding within our base budget of nearly \$544,000 is not available to make annual progress toward completion of all the projects described above and to maintain those already completed.

**Anticipated Impacts of the Use:** The refuge expects that refuge established geocache locations as part of environmental education and environmental interpretation will have negligible short-term, long-term, or cumulative impacts on the economy of the towns or county in which the refuge lies. We do not expect these activities to considerably alter the demographic or economic characteristics of the local community. No adverse impacts are foreseen to be associated with changes in the community character or demographic composition. In addition, impacts are expected to be negligible based on our observations of past visitor impacts from these uses.

Disturbance factors resulting from public use are always considered. Of these, impacts on the red-cockaded woodpecker will be minimized through the seasonal closure of designated areas during nesting season. A Section 7 evaluation has been conducted as part of this review and it was determined that proposed activities will not likely affect the red-cockaded woodpecker. The bald eagle occurs on the refuge and areas near active bald eagle nests will not be open at any time for wildlife observation, wildlife photography, and environmental education and interpretation and, therefore, are not expected to have any negative impacts on bald eagles (USFWS Service 2007).

The beneficial impacts of providing the existing level of wildlife-dependent activities, with some modest increases, include helping meet existing and future demands for outdoor recreation and education. Visitor use is increasing over time as local residents and visitors become increasingly aware of refuge opportunities, and as we progress in creating new facilities and programs. The economic benefits of increased tourism likely will also benefit local communities.

Expanded facilities for environmental education and new or expanded visitor services programs are expected to increase public awareness of, and visitation to, the refuge, and enable staff to provide better customer service. We expect a certain level of inconvenience during the construction of refuge facilities. The adverse effects generally are short-term, and more than offset by the long-term gains in public education and appreciation. Impacts to refuge resources are expected to be negligible.

---

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

- Use is Not Compatible  
 Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** The refuge will manage this activity within the existing priority public uses (environmental education and interpretation) in accordance with federal and state regulations. It will be reviewed annually to ensure that the program is providing safe, quality experiences for participants. The refuge based these stipulations on our comprehensive conservation plan and refuge-specific regulations. To ensure compatibility with refuge purposes and the mission of the Refuge System, wildlife observation, wildlife photography, and environmental education and interpretation can occur on the refuge, if the refuge-specific regulations are followed and following stipulations are met:

- (1) This use must be conducted in accordance with state and federal regulations and special refuge-specific regulations published in the Public Use Regulations brochure.
- (2) The public use program will be reviewed annually to ensure that it contributes to refuge objectives in managing quality recreational opportunities and protecting habitats, and is subject to modification if on-site monitoring by refuge personnel or other authorized personnel results in unanticipated negative impacts to natural communities, wildlife species, or their habitats. Refuge law enforcement officer(s) will promote compliance with refuge regulations, monitor public use patterns and public safety, and document visitor interactions. Refuge law enforcement personnel will monitor all areas and enforce all applicable state and federal regulations.
- (3) Refuge visitors are required to review and sign refuge-specific public use brochures.
- (4) Areas may be closed on the refuge to protect resources or prevent unwanted disturbance.
- (5) Pets allowed on a leash.
- (6) The Visitor Contact Station is open weekdays from 8 a.m. to 4 p.m. and on weekends when staffing allows.

---

(7) Members of the public will not be allowed to establish their own geocache locations; only refuge established geocache sites are authorized for use as part of the environmental education and interpretation programs.

**Justification:** Environmental education and interpretation are priority wildlife-dependent uses for the Refuge System through which the public can develop an appreciation for fish and wildlife. The Service's policy is to provide expanded opportunities for wildlife-dependent uses when compatible and consistent with sound fish and wildlife management and ensure that they receive enhanced attention during planning and management.

Specific refuge regulations address equity and quality of opportunities for visitors and help safeguard refuge habitats. Impacts from this proposal, short-term and long-term, direct, indirect, and cumulative, are expected to be minor and are not expected to diminish the value of the refuge for its stated objectives. Available parking and size of the facilities will typically limit use at any given time, except during special events.

Conflicts between visitors are localized and are addressed through law enforcement, public education, and continuous review and updating to public use regulations. Conflicts are further reduced by the establishment of seasonal area closures.

Stipulations above will ensure proper control of the means of use and provide management flexibility should detrimental impacts develop. Allowing this use also furthers the mission of the Refuge System by providing renewable resources for the benefit of the American public while conserving fish, wildlife, and plant resources on the refuge.

This activity will not materially interfere with, or detract from, the mission of the Refuge System or the purpose for which the refuge was established.

**NEPA Compliance for Refuge Use Description:** *Place an X in appropriate space.*

- Categorical Exclusion without Environmental Action Statement  
 Categorical Exclusion and Environmental Action Statement  
 Environmental Assessment and Finding of No Significant Impact  
 Environmental Impact Statement and Record of Decision

**Mandatory 10-year Re-evaluation Date:** 2025

---

**Use:** Jogging, Running, and Competitive Races

**Description of Use:** Jogging and running are not identified as a priority public use if the Refuge System under Improvement Act. Like walking and hiking, jogging and running can be another means to observe wildlife and reconnect with nature, but its primary goal is personal health. Currently, where refuge roads have been improved beyond graveled, jogging and running are occurring.

---

Jogging and running are not generally modes of transportation that facilitate wildlife-dependent recreation and are growing in popularity. Most of the current activity occurs within what will become the “Connecting People with Nature” area and the impact on the refuge and wildlife appears to be minimal. Total affected acreage is estimated at approximately 1,000 acres or 2 percent of the refuge property.

**Availability of Resources:** Approved compatible public uses will be the primary management focus. Maintenance, periodic upgrades, and improvements to public use facilities and roads will continue to be a major component of refuge activities.

The human resources to conduct a successful public use program will be provided by staff, volunteers, and partners. The Service will not have to provide special equipment or require a significant increase in staff expenditure for the available jogging opportunities, but will need to at least maintain the current staff levels. To date, annual requirements in time, materials, and supplies needed to manage and ensure the success of this area have been consistent and largely within existing refuge resources. Estimated costs associated with this use include:

Supplies and materials: \$2,000. This includes signs for closed launch sites, site closure signs, interpretive brochures, regulation brochures.

Monitoring: \$3,000 annually, to be carried out in cooperation with the states.

Law Enforcement: \$3,000 annually for a refuge officer.

**Anticipated Impacts of the Use:** Jogging and running on native surfaces can cause structural damage to plants and increase soil compaction. The degree of surface compaction is dependent on topography, soil structure, and soil moisture. Impacts of trampling on vegetation and soils are unlikely to occur on the well-defined, mulched trails, gravel roads, or paved surfaces. The Service repairs, operates, and patrols the trails and roads. Maintenance activities include mulching, pesticide spraying, road grading, and gravel replenishment, as needed. Well-maintained paved roads provide an appropriate surface for this type of user.

Jogging and running can cause wildlife disturbance. Immediate responses by wildlife to recreational activity can range from behavioral changes, physiological changes, or mortality (Knight and Cole 1995). The long-term effects are more difficult to assess. Wildlife responses to human disturbance include avoidance, habituation, and attraction (Knight and Cole 1991). A key factor in predicting how wildlife would respond to disturbance is the predictability of the activity within the habitat. The use of trails or boardwalks for wildlife viewing during predictable times will mitigate the impacts (Oberbillig 2001). Wildlife species have a greater reaction to humans moving unpredictably (Gabrielsen and Smith 1995). Migratory wildlife species tend to be more susceptible to human disturbance (Klein 1993). Wildlife may also be attracted to human presence if provided a reward. Habituation of wildlife to visitors may increase mortality of wildlife due to nuisance behavior, vehicle collisions, or illegal harvest. General visitors may be encouraged to use developed trails, roads, boardwalks, and overlooks to limit disturbances and concentrate visitor activities to less-sensitive areas.

Trails attract a variety of user groups that often has conflicting needs. Cross-country jogging may appeal to many users, and greater impact to the environment and wildlife will be expected in these areas. People with disabilities may be particularly affected by trail conflicts if they do not have the ability to quickly detect or react to hazards or sudden changes in the environment. If the number of road users increases as expected, the potential for accidents or user group conflicts may also increase.

---

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

- Use is Not Compatible  
 Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** Jogging and running will occur on designated paved surfaces only and roads open to motor vehicles. No cross country or trail jogging and running will be allowed.

Competitive races, road races, and fun runs will be allowed, but will only occur as part of a scheduled and sponsored refuge event. Competitive races by outside groups for the purpose of revenue generation will not be allowed.

Training runs by collegian sports teams will be allowed to occur along refuge paved roads under a special use permit. Again, no cross-country or trail runs will be allowed. Jogging and running will be restricted to daylight hours only.

A refuge officer will help to promote compliance with refuge regulations, monitor public use patterns and public safety, and document visitor interactions.

**Justification:** Jogging and running is not a wildlife-dependent public use of the refuge as defined by statute (16 U.S.C. 668dd et seq.), but it can contribute to the fulfillment of refuge purposes by connecting people with nature. Potential for wildlife disturbance is minimal given the non-threatening, indirect approach of this activity. Restricting the disturbance to designated established roads will increase the predictability of public use on the refuge, allowing wildlife to habituate to non-threatening activities. Moreover, consolidating compatible recreational activities to the "Connecting People with Nature" area reduces habitat fragmentation, thereby maintaining a "sanctuary area" of the refuge for more sensitive species. These impacts will be monitored. Direct costs to administer existing levels of jogging on the refuge will be minor. This activity will not materially interfere with, or detract from, the mission of the Refuge System or purposes for which the refuge was established. In addition, this activity will fulfill one or more purposes of the refuge or Refuge System.

**NEPA Compliance for Refuge Use Description:** Place an X in appropriate space.

---

**Use:** Motorized and Non-Motorized Boating for Wildlife Observation

**Description of Use:** Motorized and non-motorized boating as a lone activity is not a priority public use of the Refuge System under the Improvement Act. However, these uses may provide transport for wildlife observation, wildlife photography, hunting, and fishing. Motorized and non-motorized boating will be conducted on all open waters, including lakes and rivers within the refuge. One motorized boat access ramp will be available at Bluff Lake, Loakfoma Lake, and Ross Branch Reservoir. An additional non-motorized boat launch site will be available near Cypress Cove Boardwalk on Bluff Lake.

**Availability of Resources:** Estimated costs associated with this use include:

Routine maintenance: \$35,000 annually; this is the expected cost to maintain the three public motorized boat launches and one non-motorized boat ramp and includes repairs to the ramps base material, vegetation control, maintenance of parking areas and regulator signs, removal of garbage; and maintenance of a restroom facility.

Supplies and materials: \$3,000; this includes signs for closed launch sites, site closure signs, interpretive brochures, and regulation brochures.

Monitoring: \$3,000 annually, to be carried out in cooperation with the states and partners.

Law Enforcement: \$3,000 annually

**Anticipated Impacts of the Use:** Potential impacts of motorized and non-motorized boating:

- 
- Accidental introduction of invasive plants, pathogens, or exotic invertebrates, attached to boats.
  - Disturbance of wildlife (particularly waterfowl, eagles, and wading birds): Popular public use boating seasons in Mississippi, coincide in part, with spring-early summer nesting and brood-rearing periods for many species of aquatic-dependent birds. Boaters may disturb nesting birds by approaching too closely to nests, causing nesting birds to flush. Flushing may expose eggs to predation or cooling, resulting in egg mortality.
  - Negative impacts on water quality from motorboat and other pollutants, human waste, and litter: Extensive water quality testing on the refuge has not been carried out. The levels of pollutants from boat fuel and impacts on local aquatic systems are unknown. Hydrocarbon contamination can be harmful to fish.
  - Bank and trail erosion from human activity (boat landings, boat wakes, foot traffic), which may increase aquatic sediment loads of streams and rivers or alter riparian or lakeshore habitat or vegetation in ways harmful to fish or other wildlife.

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

- Use is Not Compatible  
 Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** The refuge will permit boat launching only at designated launches to prevent the erosion and degradation of wetlands or water quality and ensure public safety.

The refuge will close wildlife-nesting and brood-rearing areas seasonally to all boating activities, to prevent the disturbance of wildlife.

Boat launches will be constructed and situated in such a way as to provide for public safety and minimize the disturbance of wildlife and habitat or the effects of siltation.

Launching of trailered boats will not be allowed in areas without a developed launch.

The refuge will increase public outreach and education to minimize conflicts among user groups, help control aquatic invasive plants and lead in the environment, reduce the introduction of nonnative fish species, and minimize the disturbance of wildlife and habitat.

---

A refuge officer will help to promote compliance with refuge regulations, monitor public use patterns and public safety, and document visitor interactions.

Motorized and non-motorized boating will be allowed as a means to facilitate refuge public use programs, namely the priority public use programs of hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation. The use will be conducted consistent with refuge and Mississippi regulations, with some additional restrictions to protect fish, wildlife and habitat, and reduce potential conflicts among public uses.

All waters within the entire refuge will be considered a no wake area.

The public must inspect all boats and boat trailers and clean them of aquatic invasive species before launching and leaving refuge sites. Cleaning of boats should take place on dry ground well away from the water. Exotic, nuisance plants or animals on boats, trailers, diving equipment, or in bait buckets can disrupt aquatic ecosystems and negatively affect native fish and plant species.

Regulatory signs along with educational materials will be made available in high use areas.

**Justification:** Hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation are the six priority public uses of the Refuge System, and have been determined to be compatible activities on many refuges nationwide. The Improvement Act instructs refuge managers to seek ways to accommodate those six uses. Motorized and non-motorized boating is allowed as a means to facilitate these priority public uses on the refuge. Boating activities will not materially interfere with or detract from the mission of the Refuge System or the purposes for which the refuge was established. Motorized and non-motorized boating will not pose significant adverse effects on refuge resources; interfere with public use of the refuge; nor cause an undue administrative burden. In addition, this activity will fulfill one or more purposes of the refuge or Refuge System.

**NEPA Compliance for Refuge Use Description:** *Place an X in appropriate space.*

- Categorical Exclusion and Environmental Action Statement
- Environmental Assessment and Finding of No Significant Impact
- Environmental Impact Statement and Record of Decision

**Mandatory 10-year Re-evaluation Date: 2025**

---

**Use:** Picnicking in association with Wildlife-Dependent Activities

**Description of Use:** Hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation are priority public uses as defined by the Improvement Act, and if compatible, are to receive enhanced consideration over other general public uses.

---

These uses are conducted to provide compatible educational and recreational opportunities for visitors to enjoy the resources and to gain understanding and appreciation for fish and wildlife, wild lands ecology and the relationships of plant and animal populations within the ecosystem, and wildlife management. Following these activities, it is often customary for visitors to break for lunch or other meal under a picnic style setting. These activities, and the picnic that follows, provides wholesome, safe, outdoor recreation in a scenic setting, with the realization that those who come strictly for recreational enjoyment will be enticed to participate in the more educational facets of the public use program, and can then become informed advocates for the refuge and the Service.

**Availability of Resources:** Allowing picnicking as part of wildlife-dependent activities including hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation is within the resources available to administer our visitor services program with the current level of participation and to ensure that the use remains compatible with the refuge purposes. Additional funding for visitor services improvements can also come from challenge cost-share projects, grant funds, and contributions. Compliance with refuge regulations is handled within the regular duties of the law enforcement officer. As funding is available, the refuge will complete and maintain projects and facilities. Volunteers and partners will be utilized to help with construction and maintenance.

Facilities or materials needed to support this use include maintaining access roads, parking areas, roadside pull-offs, kiosks, the Visitor Contact Station, observation platforms, wheelchair-accessible fishing pier, boat launching areas, benches and tables; creating a "Connecting People with Nature" area and trail; and providing information in refuge publications and the refuge's web site.

Sufficient staff and maintenance funding within our base budget may not be available to make annual progress toward completion of all the projects described above and to maintain those already completed.

**Anticipated Impacts of the Use:** The refuge expects picnicking associated with that of hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation will have negligible short-term, long-term, or cumulative impacts on the economy of the towns or county in which the refuge lies. We do not expect these activities to considerably alter the demographic or economic characteristics of the local community. No adverse impacts are foreseen to be associated with changes in the community character or demographic composition. In addition, impacts are expected to be negligible based on our observations of past visitor impacts from these uses.

Picnicking is expected to have negligible adverse short-term, long-term, or cumulative impacts on soils, litter, local or regional air quality, and hydrology or water quality. Negative impacts to water quality can also result from human waste and litter.

Disturbance factors resulting from public use are always considered. Of these, impacts on the red-cockaded woodpecker will be minimized through the seasonal closure of designated areas during nesting season. A Section 7 evaluation has been conducted as part of this review and it was determined that proposed activities will not likely affect the red-cockaded woodpecker. The bald eagle occurs on the refuge and areas near active bald eagle nests will not be open at any time for wildlife observation, wildlife photography, and environmental education and interpretation and, therefore, are not expected to have any negative impacts on bald eagles (USFWS Service 2007).

---

Picnicking is expected to have negligible adverse short-term, long-term, or cumulative impacts on waterfowl. Providing waterfowl sanctuaries will minimize some of these impacts and allow waterfowl to have undisturbed access to these areas during biologically critical periods of the day. To minimize waterfowl disturbance from these uses, the refuge has designated waterfowl sanctuaries that closed to hunting and other recreational use on a seasonal or annual basis.

This use is expected to have negligible adverse short-term, long-term, or cumulative impacts on shorebirds and landbirds. Disturbance to landbirds in proposed areas for wildlife observation, photography, hunting and fishing, and subsequently picnicking, is expected to be negligible since all visitors will be required to be on designated walking trails and access routes.

Impacts to fisheries from visitors engaged in picnicking are expected to be temporary and minor. Public outreach and education efforts in areas used by picnickers will emphasize conservation and importance of buffering of wetlands, connectivity for wildlife between forest, grassland, and wetlands.

Visitor use is increasing over time as local residents and visitors become increasingly aware of refuge opportunities, and as we progress in creating new facilities and programs. The economic benefits of increased tourism likely will also benefit local communities. Expanded facilities for environmental education and new or expanded visitor services programs are expected to increase public awareness of, and visitation to, the refuge, and enable staff to provide better customer service.

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

- Use is Not Compatible  
 Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** The refuge will manage the six priority public uses (hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation) with the associated picnicking in accordance with federal and state regulations and review it annually to ensure wildlife and habitat goals are achieved and that these programs are providing safe, quality experiences for participants. To ensure compatibility with refuge purposes and the mission of the Refuge System, in addition to those refuge-specific regulations for hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation, the following stipulations will need to be met:

- 
- (1) No food is to be made available for use by wildlife and no wildlife shall be intentionally fed.
  - (2) The public use program will be reviewed annually to ensure that it contributes to refuge objectives in managing quality recreational opportunities and protecting habitats, and is subject to modification if on-site monitoring by refuge personnel or other authorized personnel results in unanticipated negative impacts to natural communities, wildlife species, or their habitats. Refuge law enforcement officer(s) will promote compliance with refuge regulations, monitor public use patterns and public safety, and document visitor interactions. Refuge law enforcement personnel will monitor all areas and enforce all applicable state and federal regulations.
  - (3) Refuge visitors are required to remove all trash and food products.
  - (4) Areas may be closed on the refuge to protect resources or prevent unwanted disturbance.
  - (5) Pets allowed on a leash.
  - (6) The Visitor Contact Station is open weekdays from 8 a.m. to 4 p.m. and on weekends when staffing allows.
  - (7) Picnicking as a sole activity or as part of non-wildlife dependent activities is prohibited.

**Justification:** Hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation are priority wildlife-dependent uses for the Refuge System through which the public can develop an appreciation for fish and wildlife. The Service's policy is to provide expanded opportunities for wildlife-dependent uses when compatible and consistent with sound fish and wildlife management and ensure that they receive enhanced attention during planning and management. Picnicking is seen as a reasonable part of these six priority activities.

Specific refuge regulations address equity and quality of opportunities for visitors and help safeguard refuge habitats. Impacts from this proposal, short-term and long-term, direct, indirect, and cumulative, are expected to be minor and are not expected to diminish the value of the refuge for its stated objectives. Available parking and size of the facilities will typically limit use at any given time, except during special events.

Conflicts between visitors are localized and are addressed through law enforcement, public education, and continuous review and updating to public use regulations. Conflicts are further reduced by the establishment of seasonal area closures.

Stipulations above will ensure proper control of the means of use and provide management flexibility should detrimental impacts develop. Allowing this use also furthers the mission of the Refuge System by providing renewable resources for the benefit of the American public while conserving fish, wildlife, and plant resources on the refuge.

This activity will not materially interfere with, or detract from, the mission of the Refuge System or the purpose for which the refuge was established.

**NEPA Compliance for Refuge Use Description:** *Place an X in appropriate space.*

 Categorical Exclusion and Environmental Action Statement  
 Environmental Assessment and Finding of No Significant Impact  
 Environmental Impact Statement and Record of Decision

**Mandatory 10-year Re-evaluation Date: 2025**

---

**Use:** Recreational Fishing

**Description of Use:** Recreational fishing (a wildlife-dependent activity) has been identified in the Improvement Act as a priority public use, provided it is compatible with the purposes for which the refuge was established.

Sport fishing in refuge waters is an integral part of the overall public use program. Boat ramps have been installed to facilitate sport fishing at Bluff and Loakfoma lakes. The refuge has constructed accessible piers, signs, and information kiosks to inform the public of the need for stewardship of public lands and waters and to increase the awareness of our natural resources.

Recreational fishing is a common public use in refuge waters, where fish populations support a sustainable harvest under a regulated fishing program. The refuge annual hunting and fishing permit is required to fish on the refuge. Bank fishing is conducted year-round on designated areas of Bluff and Loakfoma lakes, Noxubee River, and the borrow pits along Highway 25 from sunrise to sunset and are subject to regulations established by the Mississippi Department of Wildlife, Fisheries, and Parks. Fishing by boat and areas managed for waterfowl are open from March 1 to October 31. The Service has specific regulations further restricting fishing by prohibiting commercial fishing, the use of certain fishing methods, and access after dark.

Several methods of fishing are employed, including boat fishing, wade fishing, and bank fishing. Boat and bank fishing are permitted, as provided by refuge special regulations and those published in 50 CFR. Bank fishing will take place on designated areas with shallow slopes, mostly near existing footpaths and access trails.

**Availability of Resources:** Costs to administer and manage fishing are estimated:

- Interpretive and administrative signs and kiosks - \$7,500
- Establishment and maintenance of low impact fishing access trail - \$5,000
- Establishment of parking lot at Loakfoma Lake spillway - \$10,000
- Brochure - \$1,000
- Annual program management-salaries  
(creel surveys, law enforcement, etc.) - \$15,000
- Totals - \$38,000

---

**Anticipated Impacts of the Use:** Recreational fishing can impact the aquatic community by direct and indirect mortality (both of target and non-target species), changes in species composition and other trophic effects, and changes within species (i.e., stunting and changes in behavior) when fishing occurs at high levels (Blaber et al. 2000, Allen et al. 2005, Lewin et al. 2006). Many of the targeted species at the refuge are introduced species such as common carp that compete with native fish species. Removal of individuals of these non-native species may benefit native species by reducing competition and predation (Cornelius 2006).

Fishing can cause disturbance to birds and other wildlife that use the refuge. Species likely to experience some level of disturbance include alligators, foraging wading birds (e.g., great blue heron, American bittern, and snowy egret) foraging and nesting waterfowl (e.g., mallard, cinnamon teal, gadwall, Canada goose, and ring-necked duck), secretive marsh birds (e.g., rails), foraging and nesting passerines (e.g., red-winged blackbird and marsh wren), foraging raptors (e.g., osprey and bald eagle), and mammals (e.g., white-tailed deer and skunk).

Most research studies have focused on short-term responses to human disturbance such as flushing, nest abandonment, site avoidance, etc. Little information is available on long-term or large-scale responses such as relocation of major staging areas, changes in productivity and demographics, or changes in prey/forage selection. Fishing has been shown to affect the reproduction, distribution, behavior, and abundance of bird species (Bell and Austin 1985; Cooke 1987; Korschgen and Dahlgren 1992).

When lead fishing sinkers or jigs are lost through broken line or other means, birds can inadvertently eat them. Water birds often swallow lead when they scoop up pebbles from the bottom of a lake or river to help grind their food. Eagles ingest lead by eating fish which have themselves swallowed sinkers (Minnesota Pollution Control Agency 2012). Lead is highly toxic to fish, birds, and other animals (including humans) and therefore the use of lead fishing tackle is being banned in a growing number of states. Discarded tackle and line also pose a threat to fish-eating birds, is unsightly, and could cause a threat to aquatic biota.

Activities associated with fishing, such as human noise, will cause some birds to flush and go elsewhere. In addition, vegetation trampling, and deposition of litter or lost gear are likely to occur.

Bank stability, soil compaction, and water quality are impacted at the current participation levels and these impacts may increase should user numbers increase in the future.

As stated above, the number of anglers using the refuge is relatively low because there are limited places available for fishing opportunities. Since the level of fishing activity is low, there is very limited disturbance to birds and limited impacts to vegetation through trampling. Thus, impacts to fish and wildlife resources associated with this activity are not significant.

---

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

- Use is Not Compatible  
 Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** Anglers must park in designated parking areas and walk to fishing areas.

Camping, overnight use, and fires are prohibited.

Littering is prohibited.

All persons fishing shall be required to have a valid state license and follow applicable refuge and State of Mississippi regulations.

Law enforcement patrols will be conducted periodically to ensure compliance with state and refuge regulations.

Fishing will be allowed in designated areas. Areas showing high levels of soil compaction or erosion will be closed until repaired.

**Justification:** Fishing is listed as a priority wildlife-dependent use of the Refuge System through which the public can develop an appreciation for fish and wildlife. The Service's policy is to provide expanded opportunities for wildlife-dependent uses when compatible and consistent with sound fish and wildlife management and to ensure that they receive enhanced attention during planning and management. Although fishing can result in disturbance to wildlife and habitat, disturbances on the refuge are expected to be intermittent, minor, and short-term, and are not expected to diminish the value of the refuge for its stated purposes. Facilitating this use on the refuge will increase visitor knowledge and appreciation of fish and wildlife resources. This enhanced understanding will foster increased public stewardship of natural resources and support for the Service's management actions in achieving the refuge purposes and the mission of the Refuge System.

---

There is more than an adequate amount of undisturbed habitat available to the majority of waterfowl, waterbirds, and other wildlife for escape and cover, such that their abundance and use of the refuge will not be measurably lessened from allowing fishing to occur. Stipulations will help reduce or eliminate any unwanted impacts of the use. The relatively limited number of individual animals expected to be adversely affected due to fishing will not cause wildlife populations to materially decline, the physiological condition and production of wildlife species will not be impaired, their behavior and normal activity patterns will not be altered dramatically, and their overall welfare will not be negatively impacted. Thus, allowing fishing will not materially interfere with or detract from the mission of the Refuge System or the purposes for which the refuge was established.

**Use:** Recreational Hunting of Big Game, Small Game, and Waterfowl

**Description of Use:** This compatibility determination considers hunting, which is one of the six priority wildlife-dependent recreation activities. The primary objectives of the hunting program (archery, firearm, handicapped and youth) on the refuge are to: (1) provide a quality recreational and educational experience for a diverse audience through a varied hunt program; (2) provide an opportunity for the youth of Mississippi to engage in hunting, instill a basic understanding of conservation measures, and the role of the Service in the conservation picture; (3) foster support and knowledge of refuge goals and objectives by working in close association with the general public, and the Mississippi Department of Wildlife, Fisheries and Parks through their assistance with the harvest and thus management of resident species on the refuge while providing safe, educational, and instructive opportunities; (4) allow for the harvest of big game, small game, and waterfowl on the refuge to help maintain healthy population levels and facilitate maintenance of quality habitat for endangered species, migratory birds, and native flora and fauna; and (5) to help control nuisance and exotic wildlife.

The refuge provides annual archery, primitive weapons, and firearms hunts for white-tailed deer and turkey, quota hunts for waterfowl, and small game hunts for rabbit, squirrel, quail, raccoon, opossum, and woodcock. Because hunting has been allowed on the refuge since the 1940s, the refuge is a relatively popular public hunting destination for local hunters. All regular hunts are by refuge permit only and are conducted during specific periods within the state's hunting seasons (general hunting seasons) for Oktibbeha, Noxubee, and Winston counties. Disabled hunters are allowed to hunt in special designated areas with the issuance of a special use permit. Over 42,000 acres are currently open to public big game and small game hunting. One greentree reservoir will be open each year for waterfowl hunting and a designated area of the refuge will be open for handicapped hunting.

Three designated periods are open to youth for hunts for white-tailed deer, squirrel, and turkey on the refuge. One special squirrel hunt, in which local kids participate, is hosted by the Mississippi Department of Wildlife, Fisheries and Parks and the refuge. The refuge provides the hunt site and facilities for training, sighting-in firearms, and cleaning game. Up to fifteen youth participate, along with parents, employees, presenters, and several volunteers. The Youth Hunting Program was established to increase youth participation in safe and ethical hunting and to promote the hunting heritage of Mississippi.

---

Specific changes to the hunt program include: (1) developing a special hunting program to improve existing hunts to better accommodate individuals with disabilities on the refuge; (2) developing quality, public hunts directed toward youth (e.g., family hunts) and under-represented groups in partnership with the state; (3) developing youth hunts to get the Refuge System message across; (4) providing permitted adult hunters opportunities for mentoring youth hunters; (5) updating the refuge website to provide bilingual public hunting information; (6) continuing with certain refinements to achieve a better economy in implementing and conducting the various hunts; (7) increasing law enforcement presence on the refuge during the various hunting seasons to prevent poaching and illegal hunting in partnership with the Law Enforcement Division of Mississippi Department of Wildlife, Fisheries and Parks; and (8) providing a web-based permitting system.

**Availability of Resources:** The annual cost of refuge activities to administer the hunting program is an estimated \$66,000. These costs include staff (117 days, \$36,000) and operating expenses (\$30,000) for refuge law enforcement and hunter assistance during the hunting season. The estimate includes non-law enforcement staff activities associated with evaluating resources available for hunting (e.g., biological assessments of target species) as well as preparing for (e.g., special signage and access) and monitoring hunting activities.

Adequate refuge personnel and base operational funds are available to manage recreational hunting activities at existing and projected levels. Administrative staff time primarily involves phone conversations, written correspondence, and personal interaction with visitors at the visitor's center. There is also additional work entering activity data into a database for analysis. Field work associated with administering the program primarily involves conducting law enforcement patrols to increase recreational hunter compliance with state and federal regulations and to foster respect for local residents' activities and property.

**Anticipated Impacts of the Use:** Staff monitors both harvest trends and wildlife health to ensure that target species can be hunted at the refuge without appreciably adversely affecting these species populations. For the wildlife game species, these monitoring activities include direct observation, consultation with state and Service species specialists, and review of current species survey information and research. Recent assessments of species hunted in the vicinity of the refuge indicate that those species are not facing a general decline. For waterfowl, additional annual assessments are based upon the distribution and abundance of food resources. The State of Mississippi manages resident game across broad landscapes and allows harvest of annual surpluses through recreational hunting. Although hunting causes mortality and temporary disturbance to waterfowl and other wildlife, harvesting populations within the carrying capacity of existing habitat ensures long-term health and survival of the species.

The refuge excludes hunting activities on portions of certain refuge units. Certain areas of the refuge are not hunted specifically to provide areas of sanctuary. In some locations, special hunts are used to manage hunting pressure and overall harvest at appropriate levels.

Spring turkey hunting has the most potential for conflicting with biological activities, rookeries, and nesting sites. Areas within signed exclusion zones of the two known bald eagle nests are closed to all public use, including hunting, to avoid disturbance. Also when signed, buffer areas around colonial bird rookeries are closed to public use during the nesting season to minimize potential disturbance. This eliminates spring turkey hunting in the immediate vicinity of these vital nesting areas. Due to the dispersed and stealthy nature of turkey hunting, it presents minimal conflicts with other ground-nesting wildlife in the spring.

---

The refuge is open during the hunting season to other priority public uses such as fishing, wildlife observation, wildlife photography, and environmental education and interpretation. To safely provide both hunting and non-hunting recreational uses, the refuge enforces a series of refuge-specific hunting regulations. Hunting is not allowed on certain units or is restricted by location, date or methods of take.

Refuge management activities can be accomplished without conflict with hunting activities through the use of administratively closed areas, timing of hunts, and methods of hunt.

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

Use is Not Compatible

Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** All applicable state and federal regulations will apply.

Hunting is allowed only in designated areas.

All hunters are required to understand and possess a signed refuge Hunting and Fishing Brochure along with all applicable licenses and stamps.

Hunting is prohibited on, across, or within 100 feet of any service road, parking lot, or designated trail.

For authorized hunting activities, the refuge is open one hour before legal shooting time to one hour after legal shooting time, except for authorized hunting of raccoon or opossum. Waterfowl hunting allowed on each Wednesday and Saturday of the designated season ends each day at noon.

Archery and firearms are allowed for hunting on designated areas of the refuge.

Magnum ammunition is not allowed for the take of any game species.

The use of toxic shot, drugs, and oversized shot for hunting is prohibited within all management units containing bottomland hardwood forests on the refuge.

---

All personal property except for tree stands, including boats and cameras, must be removed at the end of each day, except for the wilderness area where all equipment must be removed daily.

No motorized machines or mechanical equipment including carts and bicycles are allowed within the wilderness area.

Falconry is prohibited.

Refuge-specific authorization is required for all special hunts.

**Justification:** Suitable habitat exists on the refuge lands to support hunting as proposed. The viability of the game species populations proposed to be hunted will not be negatively affected by hunting according to state season guidelines, bag limits, and regulations. This use is being permitted because it is a priority public use. It will not diminish the primary purposes for which the refuge was established. This use is supported in the refuge's comprehensive conservation plan. It also meets the mission of the Refuge System by providing renewable resources for the benefit of the American public while conserving viable populations of fish, wildlife, and plant resources on these lands.

Hunting is a priority public use on over 42,000 acres of the refuge. By allowing this use, we are providing opportunities and facilitating refuge programs in a manner and location that offer quality, wildlife-dependent recreation and maintain the level of current wildlife values. The harvest of surplus animals is one tool used to manage wildlife populations at a level compatible with the environment, while providing wholesome recreational opportunities.

This activity will not materially interfere with, or detract from, the mission of the Refuge System or the purpose for which the refuge was established.

**NEPA Compliance for Refuge Use Description:** *Place an X in appropriate space.*

- Categorical Exclusion without Environmental Action Statement  
 Categorical Exclusion and Environmental Action Statement  
 Environmental Assessment and Finding of No Significant Impact  
 Environmental Impact Statement and Record of Decision

**Mandatory 15-year Re-evaluation Date: 2030**

---

**Use:** Research

**Description of Use:** The use is research or other ecological or cultural investigations not conducted by the Service or a Service-authorized agent. Research is not a priority public use of the Refuge System under the Improvement Act.

---

In accordance with 16 U.S.C. 668dd(d) and 50 CFR Part 25, Subpart D, the refuge manager is responsible for reviewing applications for special use permits and determining whether to authorize a proposed use. Uses must be "appropriate," and if so, also found to be "compatible" with the refuge purposes, and those of the Refuge System, prior to being approved and undertaken. These decisions are based on the Service's best professional judgment, consistent with Service regulations and policy, including the Policy on Maintaining the Biological Integrity, Diversity, and Environmental Health of the National Wildlife Refuge System (66 Fed. Reg. 3810 (2001); 601 FW 3).

Research is conducted by federal, state, and private entities, including the U.S. Geological Survey, state departments of natural resources, students and professors at state and private universities, and independent non-government researchers and contractors. This activity will allow permitted researchers access to the refuge's natural environment to conduct both short-term and long-term research projects.

The refuge issues special use permits for research studies investigating biological, physical, or social issues and concerns to address refuge management information needs, and to enhance the understanding of trust resources.

Research permit requests will be considered on a case-by-case basis by the refuge manager. Permitted research should result in better knowledge of the refuge's natural and cultural resources and improve methods to manage, monitor, and protect these resources.

The refuge manager will always have the discretion to reevaluate the appropriateness and compatibility of any specific request for research by non-Service personnel at any time [603 FW 2.1 H(1), (2)]. A specific research project denial will be based on the refuge manager exercising sound professional judgment based on field experiences, knowledge of the refuge's natural resources, particularly its biological resources and available scientific information. When a refuge manager is exercising sound professional judgment, the refuge manager will use available information that may include consulting with others both inside and outside the Service. The refuge manager will specify in writing the rationale, conclusions, and decision when denying a specific research project request.

Sites and techniques for this use will be dependent on the particular study being conducted and could occur in a variety of habitat types. Unmanned or remotely operated vehicles may be allowed as part of research. Access will be restricted by special use permit to only the study sites needed to meet the objectives of the research. Remotely operated vehicles may be of potential use depending on study design as described by the submitted proposals.

The timing of research will be dependent on the type and subject(s) of the research project. Research could potentially occur throughout the year. Time-of-year restrictions could be imposed to protect threatened or endangered species or to prevent conflicts with other refuge uses or management activities.

Certain volunteer-based bird surveys focus on specific seasons in the avian life cycle. For example, the Christmas Bird Count is conducted during the winter. Upland bird surveys will primarily be conducted in the spring and summer, whereas wetland bird surveys may also be conducted during migration and wintering periods as well.

---

The Service encourages and supports research and management studies on refuge lands that will improve and strengthen decisions on managing natural resources. The refuge manager encourages and seeks research that clearly relates to approved refuge objectives, improves habitat management, and promotes adaptive management. Priority research addresses information on better managing the Nation's biological resources that generally are important to agencies of the Department of the Interior, the Refuge System, and state wildlife agencies that address important management issues, or demonstrate techniques for managing species or habitats.

Consideration may also be given to research and scientific work for other purposes that may not relate directly to refuge-specific objectives, but contribute to the broader enhancement, protection, use, conservation, or management of native populations of fish, wildlife, and plants, and their natural diversity in the region or the Atlantic Flyway. All proposals must comply with Service policy on compatibility.

Both the Refuge Manual and the Service Manual provide guidance on allowing research on refuges. The Refuge Manual (4 RM 6.2) lists three objectives that can be met by permitting research on refuges:

- (1) Promote new information which will improve the quality of the refuge and other Service management decisions.
- (2) Expand the body of scientific knowledge about fish and wildlife, their habitats, use of these resources, appropriate resource management, and the environment in general.
- (3) Provide the opportunity for students and others to learn the principles of field research.

The Service Manual (603 FW 1.10D (4)) provides supplemental guidance in terms of the appropriateness of research on refuges, as follows: "We actively encourage cooperative natural and cultural research activities that address our management needs. We also encourage research related to the management of priority general public uses. Such research activities are generally appropriate. However, we must review all research activities to decide if they are appropriate or not as defined in section 1.11. Research that directly benefits refuge management has priority over other research."

The rationale for this conclusion is clearly stated in the preamble to that policy (71 Fed. Reg. 36415):

Not all research may be appropriate. Some research may affect fish, wildlife, and plants in a manner neither consistent with refuge management plans nor compatible with refuge purposes or the Refuge System mission. Some research may interfere with or preclude refuge management activities, appropriate off the refuge, appropriate and compatible public uses, or other research. Some research may be appropriate off the refuge, but not on the refuge. For example, some natural and physical research may not be wildlife-dependent and may be accomplished successfully at locations off the refuge. Because not all research supports establishing purposes of refuges or the Refuge System mission, we cannot define research as a refuge management activity.

---

**Availability of Resources:** Refuge support for research may take the form of funding; in-kind services such as housing; the use of other refuge facilities, vehicles, boats, or equipment; and the direct assistance of refuge staff in collecting data, providing historical records, conducting management treatments, or providing other assistance as appropriate. Generally, however, the bulk of the costs are incurred in staff time to review research proposals, coordinate with researchers, and write special use permits. In some cases, a research project may require only a few hours of staff time to review the proposal, coordinate with other reviewers, and write a special use permit. In other cases, a research project may involve more significant staff time, because the refuge staff must coordinate with students and advisors and accompany researchers on site visits.

For projects conducted entirely by non-Service researchers, the following staff resources would be typical:

Proposal review, coordination, and special use permit preparation – Refuge Manager, 10 hours - \$560; Refuge Biologist, 20 hours - \$708; Total: \$1,268

**Anticipated Impacts of the Use: Short-term impacts:** Research activities may disturb fish and wildlife and their habitats. For example, the presence of researchers can cause waterfowl to flush from resting and feeding areas, cause disruption of birds on nests or breeding territories, or increase predation on nests and individual animals as predators follow human scent or trails. This is a potential impact of both volunteer-based bird surveys, other bird survey activities, and anuran surveys. Efforts to capture animals, such as for migratory bird banding and certain red-cockaded woodpeckers monitoring techniques, can cause disturbance, injury, or death to groups of wildlife or to individuals. To wildlife, the energy cost of disturbance may be appreciable in terms of disruption of feeding, displacement from preferred habitat and the added energy expended to avoid disturbance. These activities have been authorized in the past and Service personnel have not observed any serious impacts to refuge resources.

The removal of vegetation or sediments by core sampling methods, a common method for use in wetland research, can cause increased localized turbidity and disrupt non-target plants and animals. Sampling activities associated with many types of research activities can cause compaction of soils and the trampling of vegetation. Installation of posts, equipment platforms, collection devices, and other research equipment in open water may present a hazard if said items are not adequately marked and/or removed at appropriate times or upon completion of the project. Research efforts may also discover methods that result in a reduction in impacts described above.

**Long-term impacts:** Long term effects should generally be beneficial by gaining information valuable to refuge management. No long-term negative impacts are expected from the research activities described as none have been observed in the past; and the refuge manager can control the potential of long-term impacts through special use permits. Permits for multi-year research projects are renewed annually, providing the opportunity for an analysis of any impacts before issuing a special use permit renewal.

---

**Cumulative impacts:** Cumulative impacts will occur if multiple research projects were occurring on the same resources at the same time or if the duration of the research is excessive. In particular, the refuge must consider the potential impacts of non-Service research, in conjunction with any Service-sponsored research also taking place. However, no cumulative impacts are expected because the refuge manager can control the potential for cumulative impacts through special use permits, prohibiting multiple research projects from affecting any given area or species at one time. Managers retain the option to prohibit research on the refuge which does not contribute to the mission of the Refuge System or causes undue disturbance or harm. Managers retain the right to revoke or deny renewal for any special use permit if unanticipated short-term, long-term, or cumulative impacts are noted.

Ideally, any research project conducted on the refuge will positively contribute to one or more of the refuge goals and/or objectives. There may be short-term disturbance to plants and wildlife during field investigations — this is unavoidable in most cases. We will conduct Intra-Service Section 7 Biological Evaluations for any proposal that could be anticipated to have an impact on any federally threatened or endangered species. We will pay particular attention to the joint Service-State Bald Eagle Protection Guidelines for Mississippi. These guidelines provide distance and time-of-year restrictions for activities that could disturb nesting or roosting eagles. We will ensure that the refuge or any non-Service researchers obtain any special permits, including collection and banding permits, required by state or federal law prior to issuing a special use permit.

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

- Use is Not Compatible  
 Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:**

General

All refuge regulations will be in force and the permittee shall be responsible for the actions of all research and support personnel. Feeding any wildlife is prohibited. No fishing will be permitted while on location. Field personnel can fish on their own time when properly licensed and in areas open and accessible to the general public. No pets or other animals are allowed on the refuge during activities conducted under this permit. Violations of applicable laws or regulations may subject the permittee and/or their agents to prosecution under state and/or federal laws, and jeopardize the continuance of this permit.

---

The failure of the United States to enforce strict performance of the terms, conditions, covenants, agreements, or stipulations of this permit, for access to conduct research activities on national wildlife refuge lands, shall not constitute a waiver or relinquishment of the right of the United States to strictly enforce thereafter such terms, conditions, covenants, agreements, or stipulations which shall, at all times, continue in full force and effect.

The permittee shall save, hold harmless, defend, and indemnify the United States of America, its agents and employees for loss, damages, or judgments and expenses on account of bodily injury, death or property damage, or claims for bodily injury, death, or property damage of any nature whatsoever, and by whomever made, arising out of the permittees, his employees, subcontractors or agents with respect to conducting monitoring within the lands administered by the refuge.

Firearms of any kind are prohibited on the refuge. Killing or harassing of wildlife is prohibited. It is illegal to molest or destroy the homes, nests, or dens of wildlife. Adverse impacts on fish, wildlife, and the environment shall be minimized to the maximum extent possible.

Littering is prohibited. All cans, bottles, lunch papers, and operations trash must be removed daily. All vehicles will be equipped with a container to carry out and contain trash.  
All applicable federal and state regulations apply.

Permittee shall provide at least one written update annually that summarizes the permitted research and its current findings. Written reports should be of peer-review quality. A final report, of peer-review quality, will be provided to the refuge within 12 months of the completion of field work. Copies of all publications related to this permit will be provided to the refuge free of cost.

Publications and presentations should provide appropriate credit to the Service and the refuge.

Permits shall not be altered, erased, or mutilated, and any permit which has been altered, erased, or mutilated shall immediately become invalid.

All individuals utilizing the refuge are subject to inspection of permit, equipment, vehicles, boats and their contents by federal or state officers upon request.

#### Pre- and Post-Research/Planning

All necessary collection permits must be completed at the permittee's expense. Copies of these permits shall be provided to the refuge prior to special use permit issuance.

At the time of the official permit request, a working proposal covering project name, specific study location, problem being addressed along with specific objectives, research methods and materials, product to be produced, primary investigator, cooperators and key field persons, estimated funding amount and source of funding, and start date and completion date will be provided. Only those activities described within the proposal will be covered under this special use permit. A telephone list shall be provided by the permittee, including names of key contacts in case of questions or emergencies.

The permittee shall provide detailed maps or plats to the refuge manager clearly showing the proposed project layout, travel/access routes, and work locations. The permittee shall also

---

provide details specifying the proposed mode of transportation (vehicle type) and frequency of visits to work sites.

Field workers and supervisors must understand what is required of them. The permittee will be responsible for all actions conducted while under the authority of the permit.

Within thirty days of conclusion of the research, a final check to remove all field equipment and supplies will be made. All keys on loan from the refuge will need to be returned. All equipment left after project completion will be considered litter, unless written approval obtained from the refuge manager. Any equipment and supplies left on the refuge during the time of the study should not deter the scenic value of the area being studied. Any use of visual markers should be clearly presented within the study proposal.

#### Field Work

The permittee and their agents are required to possess a copy of this special use permit at all times when on the refuge.

The permittees and their agents are required to wear U.S. Coast Guard approved life jackets when in boats.

If access is needed behind locked gates, keys are to be checked out. The permittee will be responsible for any use of the key. All keys will be returned to the refuge once permitted research is complete for each field season. Lost keys, or key misuse, may require re-keying of all refuge locks at the cost of the permittee.

The permittee is not allowed to collect, remove, or disturb any natural materials not specifically covered within the permit.

All vehicles, boats, and equipment to be used will be in a safe and working condition. All vehicles and boats will meet or exceed federal and state requirements.

The permittee is required to contact the refuge prior to conducting initial fieldwork. A voice mail message will be sufficient. Messages shall describe planned start and end dates as well as number of personnel involved.

In the event an outboard or standard 4-wheel drive vehicle cannot be used to access interior refuge habitats, use of other specialized transportation vehicles will be approved on a case-by-case basis by the refuge manager.

All field personnel should remain in the designated work areas. All work-related travel to and from work areas will be confined to designated access routes. The permittee may acquire authorization to use motorized vehicles in areas generally closed to such, however, this authorization extends only to use of such vehicles on/in established roadways, trails, canals, and waterways. Motorized vehicles may not be used for cross-country travel unless specifically approved. Any questions field personnel have about where and how to access work areas must be directed to the refuge manager for guidance. All boat operators must have completed a boater's safety course.

Vehicle/equipment maintenance shall not occur in the field.

---

Any activities not specifically addressed and approved are not permitted without notifying the refuge manager and obtaining written specifications on the special use permit stating the activity is authorized.

At the end of the period of study, all equipment, materials, and supplies are to be removed at the expense of the permittee.

**Justification:** The Service encourages research on national wildlife refuges to promote new information which will improve the quality of refuge and other Service management decisions, to expand the body of scientific knowledge about fish and wildlife, their habitats, the use of these resources, appropriate resource management, and the environment in general, and to provide the opportunity for students and others to learn the principles of field research.

In accordance with 50 CFR 26.41, research conducted by non-Service personnel, as described in this compatibility determination, will not materially interfere with, or detract from, the fulfillment of the Refuge System mission or the purposes for which the refuge was established. In addition, this activity will fulfill one or more purposes of the refuge or Refuge System.

**NEPA Compliance for Refuge Use Description:** *Place an X in appropriate space.*

 Environmental Assessment and Finding of No Significant Impact  
 Environmental Impact Statement and Record of Decision

**Mandatory 10-year Re-evaluation Date:** 2025

---

**Use:** Wildlife Observation, Wildlife Photography, and Environmental Education and Interpretation

**Description of Use:** Wildlife observation, wildlife photography, and environmental education and interpretation are priority public uses as defined by the Improvement Act, and if compatible, are to receive enhanced consideration over other general public uses.

These uses are conducted to provide compatible educational and recreational opportunities for visitors to enjoy the resource and to gain understanding and appreciation for fish and wildlife, wild lands ecology and the relationships of plant and animal populations within the ecosystem, and wildlife management. These uses will provide opportunities for visitors to observe and learn about wildlife and wild lands at their own pace in an unstructured environment and to observe wildlife habitats firsthand. These uses will enhance the public's understanding of natural resource management programs and ecological concepts to enable the public to better understand the problems facing our wildlife/wild lands resources, to realize what effect the public has on wildlife resources, to learn about the Service's role in conservation, to better understand the biological facts upon which Service management programs are based, and to foster an appreciation for the importance of wildlife and wild lands. It is anticipated that participation in these uses will result in a more informed public, with an enhanced stewardship ethic and enhanced support and advocacy for Service programs.

---

These uses will also provide wholesome, safe, outdoor recreation in a scenic setting, with the realization that those who come strictly for recreational enjoyment will be enticed to participate in the more educational facets of the public use program, and can then become informed advocates for the refuge and the Service.

The use will be conducted within the refuge's boundary. While the refuge will be open to these uses, the majority of the public use infrastructure is located near the refuge headquarters. Currently, 7 miles of hiking trails, 3 observation towers, 2 boardwalks, informational kiosks, 2 boat ramps, and a visitor center is located near the refuge headquarters. We plan to enhance this "Connecting People with Nature" area to provide additional opportunities. The "Connecting People with Nature" area will highlight wildlife observation, wildlife photography, and environmental education and Interpretation. This area will include interpretive signs, informational kiosks, observation towers, and benches along the trail.

Uses will be conducted for the general public, as well as for organized groups, including schools and scout groups. Brochures and maps depicting the roads and trails open for these uses are available at the Visitor Contact Station, kiosks, and on the refuge's web site.

Environmental education and interpretation will be conducted by way of personal presentations by staff and volunteers, teachers and other youth leaders, and at special events and displays both on and off the refuge. Educational and interpretive information will also be provided via signage, kiosks, printed information, exhibits, audiovisual presentations, and lecture programs. Wildlife observation and photography are self-conducted and are facilitated through the availability of trails, viewing areas, tours, and informational materials. Wildlife observation programs such as birding field trips, canoe trips, and other nature walks are frequently given. Viewing scopes are provided in designated areas. The refuge also promotes wildlife photography with the Friends group through the annual nature photography contest and exhibition.

**Availability of Resources:** Allowing the use of wildlife observation, wildlife photography, and environmental education and interpretation is within the resources available to administer our visitor services program with the current level of participation and to ensure that the use remains compatible with the refuge purposes. Additional funding for visitor service improvements can also come from challenge cost-share projects, grant funds, and contributions. Compliance with refuge regulations is handled within the regular duties of the law enforcement officer. As funding is available, the refuge will complete and maintain projects and facilities. Volunteers and partners will be utilized to help with construction and maintenance.

Facilities or materials needed to support this use include maintaining access roads, parking areas, gates, roadside pull-offs, kiosks, signs, the Visitor Contact Station, observation platforms, wheelchair-accessible fishing pier, boat launching areas, and hiking trails; creating a "Connecting People with Nature" area and trail; and providing information in refuge publications and the refuge's web site.

Sufficient staff and maintenance funding within our base budget of nearly \$544,000 is not available to make annual progress toward completion of all the projects described above and to maintain those already completed.

---

**Anticipated Impacts of the Use:** The refuge expects that wildlife observation, wildlife photography, and environmental education and interpretation will have negligible short-term, long-term, or cumulative impacts on the economy of the towns or county in which the refuge lies. We do not expect these activities to considerably alter the demographic or economic characteristics of the local community. No adverse impacts are foreseen to be associated with changes in the community character or demographic composition. In addition, impacts are expected to be negligible based on our observations of past visitor impacts from these uses.

Wildlife observation, wildlife photography, and environmental education and interpretation are expected to have negligible adverse short-term, long-term, or cumulative impacts on soils, local or regional air quality, and hydrology or water quality. Environmental education activities that involve the sampling of wetlands and ponds could cause temporary, localized, minor impacts on water quality as the students disturb the bottom of the pond or walk on the marsh to gather specimens. Negative impacts to water quality can also result from human waste and litter.

Wildlife observation, wildlife photography, and environmental education and interpretation are expected to have negligible adverse short-term, long-term, or cumulative impacts on vegetation, because any increases in visitation are not expected to have any negative impacts to vegetation from what is already occurring.

Additionally, hiking, wildlife viewing, photography, and environmental education programs can result in trampling of vegetation. The staff has not observed any impacts as a result of trampling of vegetation under current conditions.

Disturbance factors resulting from public use are always considered. Of these, impacts on the red-cockaded woodpecker will be minimized through the seasonal closure of designated areas during nesting season. A Section 7 evaluation has been conducted as part of this review and it was determined that proposed activities will not likely affect the red-cockaded woodpecker. The bald eagle occurs on the refuge and areas near active bald eagle nests will not be open at any time for wildlife observation, wildlife photography, and environmental education and interpretation and, therefore, are not expected to have any negative impacts on bald eagles (USFWS Service 2007).

Wildlife observation, wildlife photography, and environmental education and interpretation are expected to have negligible adverse short-term, long-term, or cumulative impacts on waterfowl. Providing waterfowl sanctuaries will minimize some of these impacts and allow waterfowl to have undisturbed access to these areas during biologically critical periods of the day. To minimize waterfowl disturbance from these uses, the refuge has designated waterfowl sanctuaries that closed to hunting and other recreational use on a seasonal or annual basis.

This use is expected to have negligible adverse short-term, long-term, or cumulative impacts on shorebirds and landbirds. We expect indirect impacts to landbirds to increase due to proposed expansions in public use activities including wildlife observation, wildlife photography, and environmental education and interpretation. Disturbance to landbirds in proposed areas for wildlife observation, wildlife photography, and fishing is expected to be negligible, since all visitors will be required to be on designated walking trails and access routes.

---

Wildlife observation, wildlife photography, and environmental education and interpretation are expected to have negligible adverse short-term, long-term, or cumulative impacts on secretive marsh and waterbirds. An increase in the number of hiking trails, particularly in or near wetland areas, has the potential to increase disturbance to secretive marsh and waterbirds. We expect negligible impacts to secretive marsh and waterbirds due to proposed expansions in public use activities.

Impacts to fisheries from visitors engaged in wildlife observation, wildlife photography, and environmental education and interpretation are expected to be temporary and minor. Use of boats and canoes will cause increased suspension of bottom sediments, which should not adversely affect biological oxygen demand for fisheries resources. Boat motors may also harm submerged or emergent vegetation, which may cause a negligible negative impact to protective cover for fisheries.

Wildlife observation, wildlife photography, and environmental education and interpretation are expected to have negligible adverse short-term, long-term, or cumulative impacts on mammals. We also evaluated these uses for their potential to benefit or adversely affect amphibians and reptiles or their habitats used for mating, reproduction, over-wintering, and foraging. Public outreach and education efforts by the refuge that emphasize buffering of wetlands, connectivity and easy access between forests, grasslands, and wetlands, protection of vernal pools, and augmentation of patch size will benefit amphibians and reptiles on an even larger scale where embraced by other landowners. Additionally, impacts to invertebrates such as butterflies, moths, other insects, and spiders are expected to be negligible.

The beneficial impacts of providing the existing level of wildlife-dependent activities, with some modest increases, include helping meet existing and future demands for outdoor recreation and education. Visitor use is increasing over time as local residents and visitors become increasingly aware of refuge opportunities, and as we progress in creating new facilities and programs. The economic benefits of increased tourism likely will also benefit local communities.

Expanded facilities for environmental education and new or expanded visitor services programs are expected to increase public awareness of, and visitation to, the refuge, and enable staff to provide better customer service. We expect a certain level of inconvenience during the construction of refuge facilities. The adverse effects generally are short-term, and more than offset by the long-term gains in public education and appreciation. Impacts to refuge resources are expected to be negligible.

**Public Review and Comment:** A Notice of Availability was published in the *Federal Register* on Thursday August 28, 2014 (79 FR 51356). The public review and comment period began on August 28, 2014 and ended on October 27, 2014. Methods used to solicit public review and comment included posted notices at refuge headquarters on the website and Facebook pages and area locations; copies of the draft comprehensive conservation plan distributed to adjacent landowners, the public, and local, state, and federal agencies; public meetings; news releases to area newspapers including: Winston County News, Starkville Daily News, Neshoba Democrat, Commercial Dispatch, Macon Beacon, Pontotoc News, Columbus Packet, The Reflector, Daily Times Leader, WMAB 89.9, and WLSM 107.1 radio station. The Winston County Journal published the news release on September 3, 2014.

Appendix D summarizes the public comments.

**Determination (check one below):**

---

Use is Not Compatible

Use is Compatible with the Following Stipulations

**Stipulations Necessary to Ensure Compatibility:** The refuge will manage these four priority public uses (wildlife observation, wildlife photography, and environmental education and interpretation) in accordance with federal and state regulations and review it annually to ensure wildlife and habitat goals are achieved and that these programs are providing safe, quality experiences for participants. The refuge based these stipulations on the 1993 public use plan, comprehensive conservation plan, and refuge-specific regulations.

To ensure compatibility with refuge purposes and the mission of the Refuge System, wildlife observation, wildlife photography, and environmental education and interpretation can occur on the refuge if the refuge-specific regulations are followed and following stipulations are met:

- (1) These uses must be conducted in accordance with state and federal regulations (50 CFR), and special refuge-specific regulations published in the Public Use Regulations brochure.
- (2) The public use program will be reviewed annually to ensure that it contributes to refuge objectives in managing quality recreational opportunities and protecting habitats, and is subject to modification if on-site monitoring by refuge personnel or other authorized personnel results in unanticipated negative impacts to natural communities, wildlife species, or their habitats. Refuge law enforcement officer(s) will promote compliance with refuge regulations, monitor public use patterns and public safety, and document visitor interactions. Refuge law enforcement personnel will monitor all areas and enforce all applicable state and federal regulations.
- (3) Refuge visitors are required to review and sign refuge-specific public use brochures.
- (4) Areas may be closed on the refuge to protect resources or prevent unwanted disturbance.
- (5) Pets allowed on a leash.
- (6) The Visitor Contact Station is open weekdays from 8 a.m. to 4 p.m. and on weekends when staffing allows.
- (7) The following activities are prohibited, including, but not limited to: camping, roller blading, horseback riding, geocaching and metal detecting, off-road and mountain biking, off-road vehicles including ATVs, organized group events (e.g., cross-country races), operation of model boats and airplanes, swimming, waterskiing, personal watercraft, air thrust boats, soliciting of funds (per 50 CFR 27.97 for Private Operations and per 50 CFR 27.86 for Begging), and other activities identified in 50 CFR 27.

**Justification:** Wildlife observation, wildlife photography, and environmental education and interpretation are priority wildlife-dependent uses for the Refuge System through which the public can develop an appreciation for fish and wildlife (Executive Order 12996, March 25, 1996, and the Improvement Act.) The Service's policy is to provide expanded opportunities for wildlife-dependent uses when compatible and consistent with sound fish and wildlife management and ensure that they receive enhanced attention during planning and management.

---

Specific refuge regulations address equity and quality of opportunities for visitors and help safeguard refuge habitats. Impacts from this proposal, short-term and long-term, direct, indirect, and cumulative, are expected to be minor and are not expected to diminish the value of the refuge for its stated objectives. Available parking and size of the facilities will typically limit use at any given time, except during special events.

Conflicts between visitors are localized and are addressed through law enforcement, public education, and continuous review and updating of public use regulations. Conflicts are further reduced by the establishment of seasonal area closures.

Stipulations above will ensure proper control of the means of use and provide management flexibility should detrimental impacts develop. Allowing this use also furthers the mission of the Refuge System by providing renewable resources for the benefit of the American public while conserving fish, wildlife, and plant resources on the refuge.

This activity will not materially interfere with, or detract from, the mission of the Refuge System or the purpose for which the refuge was established.

## *Appendix G. Intra-Service Section 7 Biological Evaluation*

**SOUTHEAST REGION  
INTRA-SERVICE SECTION 7  
BIOLOGICAL EVALUATION FORM**  
(Federally endangered, threatened, and candidate species)

Originating Person: Steven Reagan  
Phone: 662-323-5548 Email: steve\_reagan@fws.gov  
Date: February, 2014

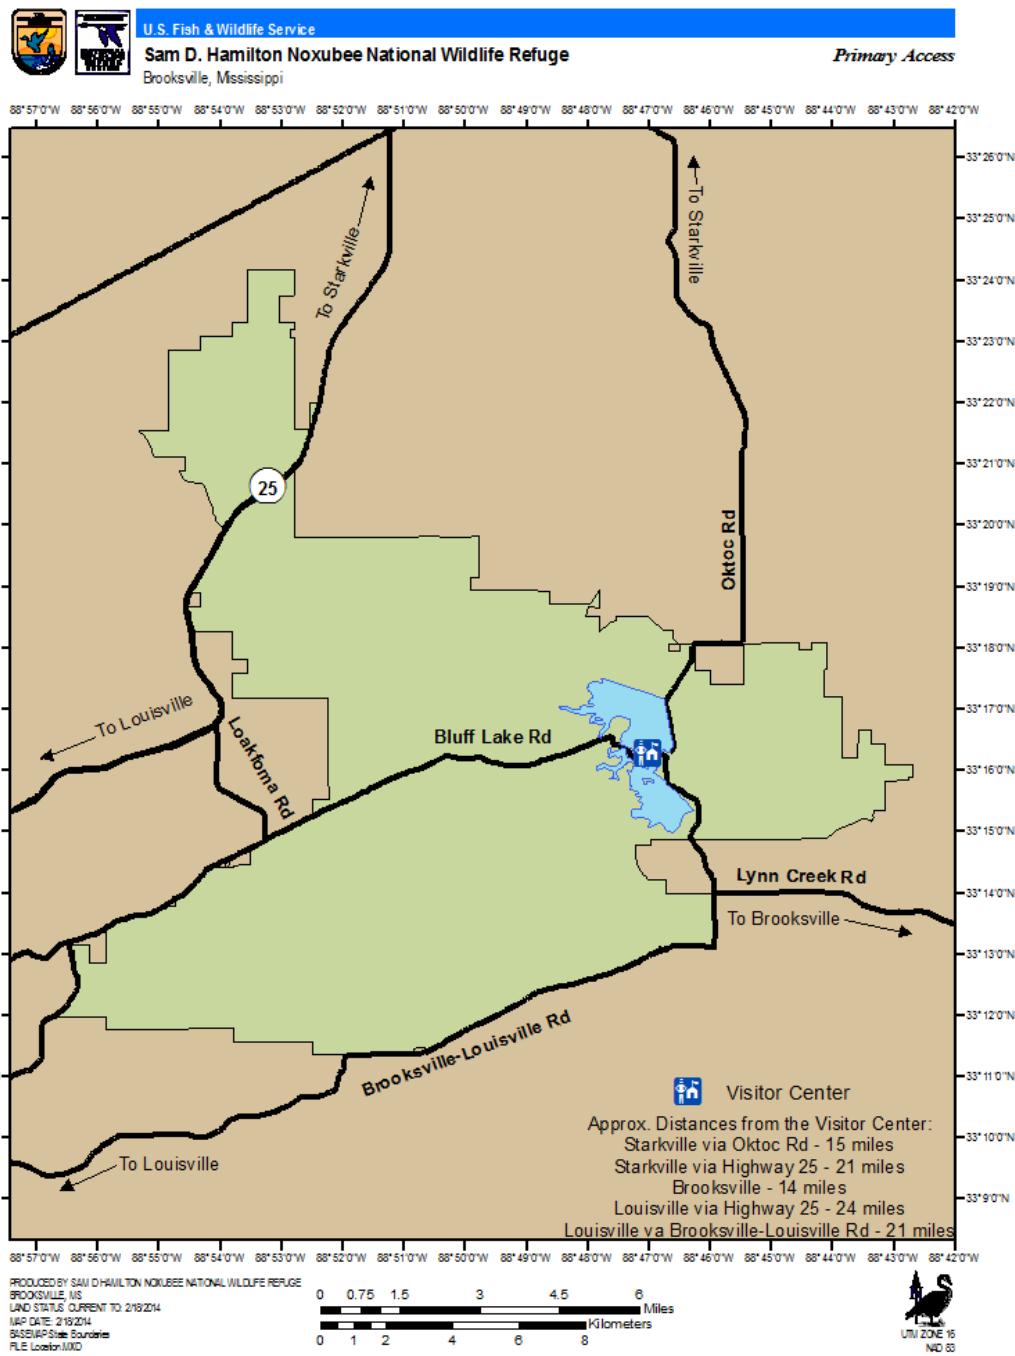

**PROJECT NAME:** Sam D. Hamilton Noxubee National Wildlife Refuge Comprehensive Conservation Plan

- I. Service Program:** Refuges/Wildlife
- II. State/Agency:** Mississippi/ United States Fish and Wildlife Service
- III. Station Name:** Sam D. Hamilton Noxubee National Wildlife Refuge

**IV. Description of Proposed Action:**

Implementation of the Comprehensive Conservation Plan for Sam D. Hamilton Noxubee National Wildlife Refuge by adopting the preferred alternative: Focus on migratory birds, federally listed species, native wildlife, habitat diversity, and experiencing nature. This plan will provide guidance, management direction, and operation plans for the next 15 years.

- V. Pertinent Species and Habitat:**
- A. Red-cockaded woodpeckers occur throughout refuge uplands in pine and pine/hardwood mixed forests.
  - B. Wood Storks occur in wetland and shallow water habitats on the refuge particularly those associated with the Jones Creek Unit and Bluff and Loakfoma lakes.

**Figure 1. Location Map**

---

A. Complete the Following table:

SPECIES/CRITICAL HABITAT	STATUS
Wood stork	T
Red-Cockaded Woodpecker	E

<sup>1</sup>STATUS: E=endangered, T=threatened, PE=proposed endangered, PT=proposed threatened, CH=critical habitat, PCH=proposed critical habitat, C=candidate species

**VI. Location (attached map):**

- A. Ecoregion Number and Name:** 29; Central Gulf Coast
- B. County and State:** Oktibbeha, Noxubee, and Winston counties, Mississippi
- C. Section, township, and range:** Latitude: 33 16; Longitude: 88 47
- D. Distance (miles) and direction to nearest town:** 15 miles east to Brooksville, Mississippi
- E. Sam D. Hamilton Noxubee National Wildlife Refuge Location:**

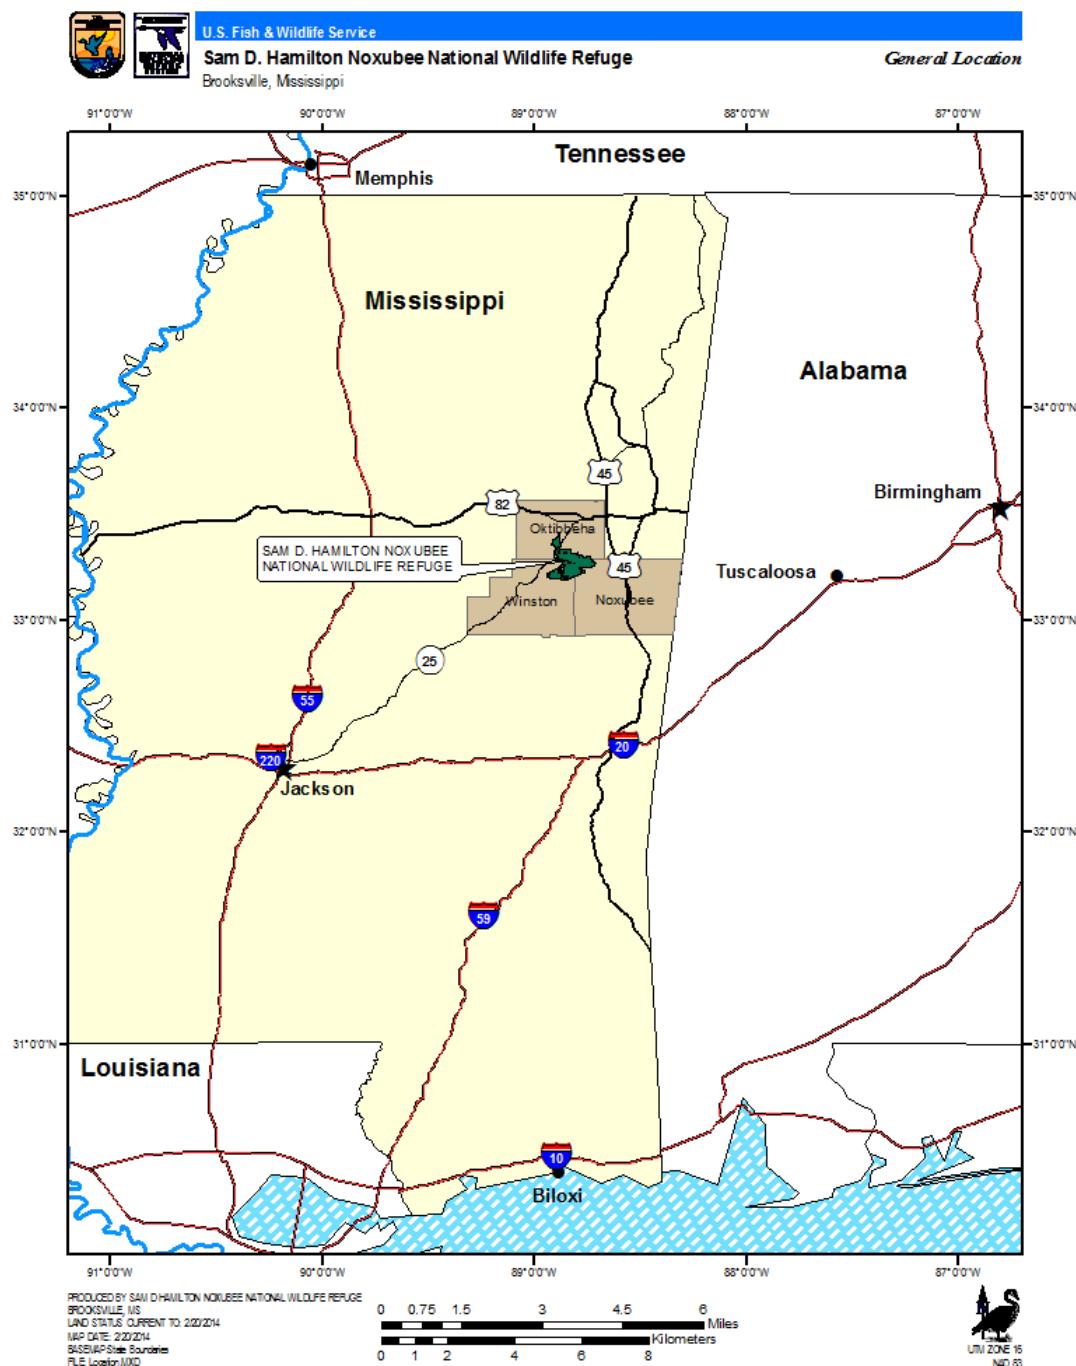

Figure 2. General Location Map

## VII. Determination of effects

### A. Explanation of effects of the action on species and critical habitats and mitigation:

Table 2. Species 1. Project impacts to listed/proposed species/critical habitat and actions to mitigate or minimize impacts. NOTE: Please see attached documentation as well.

Species/Critical Habitat	ACTIONS TO MITIGATE/MINIMIZE IMPACTS
Red-cockaded woodpecker/ Pine and mixed pine/hardwood forests	<p>When regeneration occurs, suitable or potentially suitable foraging habitat will be temporarily reduced, but is not likely to adversely affect RCWs because sufficient habitat will remain at or in positive excess of the Managed Stability Standard (MSS). This habitat will be determined and allocated by foraging habitat analysis. The refuge will take no management actions that will reduce habitat below managed stability standard (MSS). (See Habitat Management Unit worksheet 3, 4, 11 &amp; 17 below)</p> <p>Other silvicultural operations (i.e., thinning, mulching, right-of-way maintenance, emergency actions, integrate pest management and stand improvements) will be mitigated through reconnaissance and marking with white bands of known cavity trees prior to treatments and ongoing monitoring of work being completed. Operations will be prohibited from cutting or otherwise damaging cavity trees. The refuge will take no management actions that will reduce habitat below managed stability standard (MSS). (See Habitat Management Unit worksheet 3, 4, 11 &amp; 17 below)</p> <p>RCWs will not be harassed during nesting/breeding season by the operation of forestry equipment and the refuge uses a buffer of 200 feet around each RCW cluster center. During the breeding season, forest equipment operations will be prohibited within clusters. The refuge is closed to all forestry activities after dark.</p> <p>Monitoring and research including the capture of birds, banding, inspecting cavities, and translocation will be conducted by properly trained individuals as authorized by Service permits issued under section 10(a)(1)(A) of the Endangered Species and permit conditions. The risk for injuring or killing RCWs during these activities by trained and experienced personnel is very low and authorized by the 2003 biological opinion and its required conditions for management, monitoring, and research permits issued to all private, state, and federal agencies and individuals involved with management, conservation, and recovery of the RCW throughout the range of the</p>

species.

The refuge personnel will rake at least three feet in diameter around the trees to avoid high fuel loads, use low intensity burns on a sufficient burn cycle, spot fire around active trees while personnel are present and monitor cluster impacts after the fire. Prescribed burning is conducted within prescribed parameters. If actual conditions or fire behavior moves outside of prescription parameters after burn operations are initiated, the burn may be terminated or completed at the discretion of the burn boss based on firefighter/public safety, observed fire behavior, and other factors. Prescribed burning will not be conducted within active RCW cavity tree cluster sites during severe drought conditions (use an appropriate Keetch-Byram Drought Index (KBDI) for local conditions. (See Habitat Management Unit worksheet 3, 4, 11 & 17 below)

The use of chemicals to control undesired woody understory or exotic/invasive species will be mitigated by ensuring employees' use all proper techniques that are outlined in the refuge pesticide use proposal system to include proper chemicals used, application rates followed, and use of trained applicators. (See Habitat Management Unit worksheet 3, 4, 11 & 17 below)

Creation of new artificial cavities, bark shaving, use of restrictor plates, and use of excluders for RCWs will occur as often as possible by recycling of existing cavity trees (i.e., install new cavity in same tree) and avoid scarring of the cambium during bark shaving. Use of restrictor plates helps prolong the life of existing cavities thus delaying the need for new installations. The biggest risk with artificial cavities is if they are improperly installed, leak sap, or are not adequately maintained against sap leakage. The installation of such cavities will be conducted by trained personnel in accordance with the requirements of the existing programmatic BiOp for such activities. (See Habitat Management Unit worksheet 3, 4, 11 & 17 below)

If any adverse effects from public use on the existing RCW Trail near cluster 14 on the refuge are documented in the future, measures will be taken to either close the area completely or at least during breeding/nesting season.

Maintenance of roads, trails, and related infrastructure will be mitigated by limiting maintenance activities near clusters to non-nesting seasons and avoid early morning and late evening hours. No maintenance activities will occur after dark.

Maintenance of facilities located near clusters will be mitigated by

limiting maintenance activities to non-nesting seasons and avoid early morning and late evening hours. No maintenance activities will occur after dark. All administrative areas will be managed as habitat.

Creating and maintain firebreaks will not be allowed within RCW clusters during the breeding and nesting season. Otherwise, there is no need to avoid such work whether early or late in the day elsewhere. Refuge boundary maintenance near clusters will be mitigated by limiting maintenance activities within clusters to non-nesting seasons. (See Habitat Management Unit worksheet 3, 4, 11 & 17 below)

---

**B. Explanation of effects of the action on species and critical habitats and mitigation:****Table 3. Species 2. Project impacts to listed/proposed species/critical habitat and actions to mitigate or minimize impacts.**

<b>Species/Critical Habitat</b>	<b>Impacts to Critical Species/Habitat</b>
Wood Stork/wetland and shallow water habitats	<p>Sam D. Hamilton Noxubee National Wildlife Refuge is currently located in the migration route of both eastern and western populations of wood storks. Upwards of 10% of the post-breeding and non-breeding stork population migrates into eastern Mississippi. Each summer, wood storks forage in wetland and shallow water habitats on the refuge particularly those associated with the Jones Creek Unit and Bluff and Loakfoma lakes. Stork numbers gradually increase starting with June and peak in July as birds undergo a reverse summer migration following receding water conditions. Towards early September storks return to their breeding grounds. Currently, there are no breeding pairs of wood storks found on the refuge. Water management and the drawdowns of the lakes are used to provide wood stork with isolated water bodies where fish can be found stranded.</p> <p>Excessive drawdowns of the lakes could impact the wood stork through complete removal of the fisheries and depleting the bird's seasonal food resources. Given the bird's seasonal use of the refuge, there are no other management actions or proposed projects that are expected to impact the wood stork at this time.</p>
<b>Species/Critical Habitat</b>	<b>ACTIONS TO MITIGATE/MINIMIZE IMPACTS</b>

---

Wood Stork/wetland and shallow water habitats	<p>Creation of deep water habitat for fish can protect loss of fish during drawdowns and lead to the establishment of wooded islands for future roosting habitat.</p> <p>Water quality will be protected by using the BMPs and the Service's pesticide use proposal process. High water natural flood events from the Noxubee River will promote natural hydrological functions and restocking of Bluff Lake. Protection of streams from physical disturbance protects water quality and stream integrity and structure. Drawdowns of lakes encourage herbaceous growth and structure and increase fish productivity. Boating speed is limited to no wake and helps deter disturbance to wood stork and other waterbirds.</p>
---	---

### VIII. Effect Determination and Response Requested:

Table 4. The effect determination and response requested for Impact to each proposed/listed species/critical habitat.

SPECIES/ CRITICAL HABITAT	DETERMINATION <sup>1</sup>			RESPONSE <sup>1</sup> REQUESTED
	NE	NA	A	
Red-cockaded woodpecker		X		
Wood stork	X			

<sup>1</sup>DETERMINATION/ RESPONSE REQUESTED:

NE = no effect. This determination is appropriate when the proposed action will not directly, indirectly, or cumulatively impact, either positively or negatively, any listed, proposed, candidate species or designated/proposed critical habitat. Response Requested is optional but a "Concurrence" is recommended for a complete Administrative Record.

NA = not likely to adversely affect. This determination is appropriate when the proposed action is not likely to adversely impact any listed, proposed, candidate species or designated/proposed critical habitat or there may be beneficial effects to these resources. Response Requested is a "Concurrence".

AA = likely to adversely affect. This determination is appropriate when the proposed action is likely to adversely impact any listed, proposed, candidate species or designated/proposed critical habitat. Response Requested for listed species is "Formal Consultation", Response requested for proposed and candidate species is "Conference".

# Management Units 3, 4, 11 & 17 within the Habitat Management Plan

## MANAGEMENT UNIT 3 (Ennis Road Unit)

---

**Resources of Concern:**

Red-cockaded Woodpecker

Forest Breeding Birds (surrogates: Louisiana waterthrush and Wood thrush)

**Species of Complimentary Need:**

Wild turkey (*Meleagris gallopavo*)

White-tailed deer (*Odocoileus virginianus*)

Gray squirrel (*Sciurus carolinensis*)

Reptiles/Amphibians

Bats

Wood duck (*Aix sponsa*)

**Habitat Objective:** 1.3

**Current Condition and Special Considerations:**

Management Unit 3 consists of 1,270 acres of interspersed pine, mixed pine-hardwood and hardwood primarily located south of Chinchahoma Creek, with numerous fingers of streamside management zones extending throughout the unit. Management Unit 3 is similar in habitat type as Management Unit 1; the two are divided by Management Unit 2. Ennis Road, a public road, runs northwesterly and southeasterly along the west boundary. Highway 25 serves as the southeast border of the management unit. Craig Pond Road, a refuge administrative road, extends east and west through a short section near the northern end of the unit. The unit contains first, second, and third order streams.

Historic habitat analysis for this unit indicates the potential for historic conditions as having interspersed island habitats of loblolly pine-willow oak-1 (59 percent) surrounded by bald cypress-Atlantic white cedar-red maple-5 (27 percent) and fingers of American sycamore (*Platanus occidentalis*)—sugarberry (*Celtis laevigata*)—pine-3 (4 percent) habitat types and shortleaf pine – oaks-1 (6 percent)(LANDFIRE); five other habitat types make up the remaining 4 percent of the unit. The current habitat condition of the management unit appears of consistent type with past forest prescriptions designed to favor the loblolly pine. The site index for both pine and hardwood tree species within this unit is high and more than 60. Japanese climbing fern (*Lygodium japonicum Thunb. Ex Murr.*), Japanese stilt grass (*Microstegium vimineum*), privet (*Ligustrum vulgare*), and cogon grass (*Imperata brasiliensis*) continue to be a threat and all or one of these pests have been spot treated in the past. Japanese stilt grass can be found within the unit. The area possesses no private inholdings or old field habitats.

With the 1995 Forest Management Plan, the refuge established goals to manage the management unit and all habitats within it for RCWs and as of 2012, five clusters were established within the unit. The most recent RCW Forage Habitat Analysis shows this unit as not providing sufficient GQFH for the three inactive clusters and two active clusters. Chemical hardwood control has been used in areas immediately around RCW clusters but not widely throughout the unit. Of these five clusters, three were natural starts, with the others being artificially created. Today, two clusters remains active (Clusters 82 and 28) and all others considered abandoned. A third active cluster, Cluster 95, located in Management Unit 4, has it a portion of its partition overlapping into this management unit.

---

Through time the unit has infrequently been treated with fire to control the hardwood midstory; very minimal prescribed fire has been used within the last several years. Approximately 9 miles of fire lines have been established throughout the unit extending along and across the intersecting waterways. Prescribed fire within this unit has been difficult due to wet soil conditions and limited access. Any residual smoke remaining after burns will settle in drains running across Highway 25. The northern boundary of this unit is within 3 miles of Starkville city limits.

River cane (*Arundinaria gigantea*) is found within this unit's waterways but sparse in occurrence. Due to increased soil wetness, prescribed fire carries less readily and hardwood regeneration occurs more readily. This unit serves as habitat for a suite of species including neotropical migratory birds, wild turkey, white-tailed deer, pileated woodpecker (*Dryocopus pileatus*), southern flying squirrel (*Glaucomys volans*), and numerous species of herpetofauna.

**Unique Features:**

The management unit has a church property inholding and a power line right of way in the southeast corner of the management unit. Craig Pond Road also bisects this unit. There may be numerous historical sites including old home sites, cisterns, and artifacts from Native Americans.

**Management Prescription:**

Except within the active and, if needed, identified recruitment RCW cluster partitions, habitat within Management Unit 3 will be managed for Louisiana waterthrush and wood thrush, by providing complex vertical and horizontal structure for nesting and foraging. Louisiana waterthrush and wood thrush will serve as the surrogate species of other priority forest birds. Group tree selection and free thinning could be used to create canopy gaps to promote forest structure and an intermixed forest with dominate, shade-intolerant trees with expansive, long-limbed crowns that overtop large, individual, shade tolerant trees. Canebrakes will be encouraged to develop within canopy gaps. Triggers for prescribed silvicultural treatments will be:

- (1) Overstory canopy cover: >70%
- (2) Midstory cover: <25%
- (3) Basal area: >70 square feet per acre
- (4) More than 25% of basal area approaching biological maturity (i.e., senescence)
- (5) Tree stocking >70%

**Forest Management**

During the next 15-year period, the majority of the area within this unit may be managed for RCW. All other areas outside the managed partitions will likely be allowed to follow natural successional patterns with active management focused on exotic plant control. Habitat within the active partitions will be directed toward providing at least 120 acres of GQFH per partition as defined by the Red-cockaded Woodpecker Recovery Plan. When determined necessary, this same habitat management may also occur within no more than two recruitment clusters for a total of up to four partitions (counting Cluster 95). Individual hardwood trees having particular wildlife value (i.e., den trees, cavity trees, and other unique characters) may be left growing throughout the pine dominated areas but canopy hardwoods will be kept to below 30 percent of canopy.

---

Free thinning along with chemical treatments and prescribed fire will be used toward providing GQFH within a minimum of 120 acres of mature pine forest within the cluster. No silvicultural regeneration treatments for pine will occur within the partitions unless the partition contains more than 120 acres of pine habitat. No new recruitment clusters will be formed beyond the targeted four clusters and all abandoned clusters will be managed for historic habitat conditions and forest breeding birds.

Natural fire breaks will be favored to minimize the amount of artificial fire breaks installed or maintained between management units. Existing fire lines near the active clusters will be maintained to contain fire and new lines will be established if needed for the same purpose.

### **Aquatic Management**

SMZs will be protected based on stream order and the minimums defined previously. Prescribed fire will normally be allowed to burn into SMZs with site conditions (e.g., wetness) dictating burn extent into the zone. Fire will be excluded from SMZs when habitat conditions indicate impacts to regeneration, mortality of canopy trees, and increased soil erosion. Timber management may occur within the SMZs under guidelines within Mississippi's Best Management Practices for Forestry (2008), if needed to maintain the desired forest conditions. Beaver ponds will be allowed to form naturally within the creek channels to benefit wood ducks, but beaver population and dam control actions will be used to keep beaver activity confined to the channels. All water managed by beavers that impacts live timber during the growing season will be removed and when needed beaver numbers controlled.

### **Administrative Use Lands**

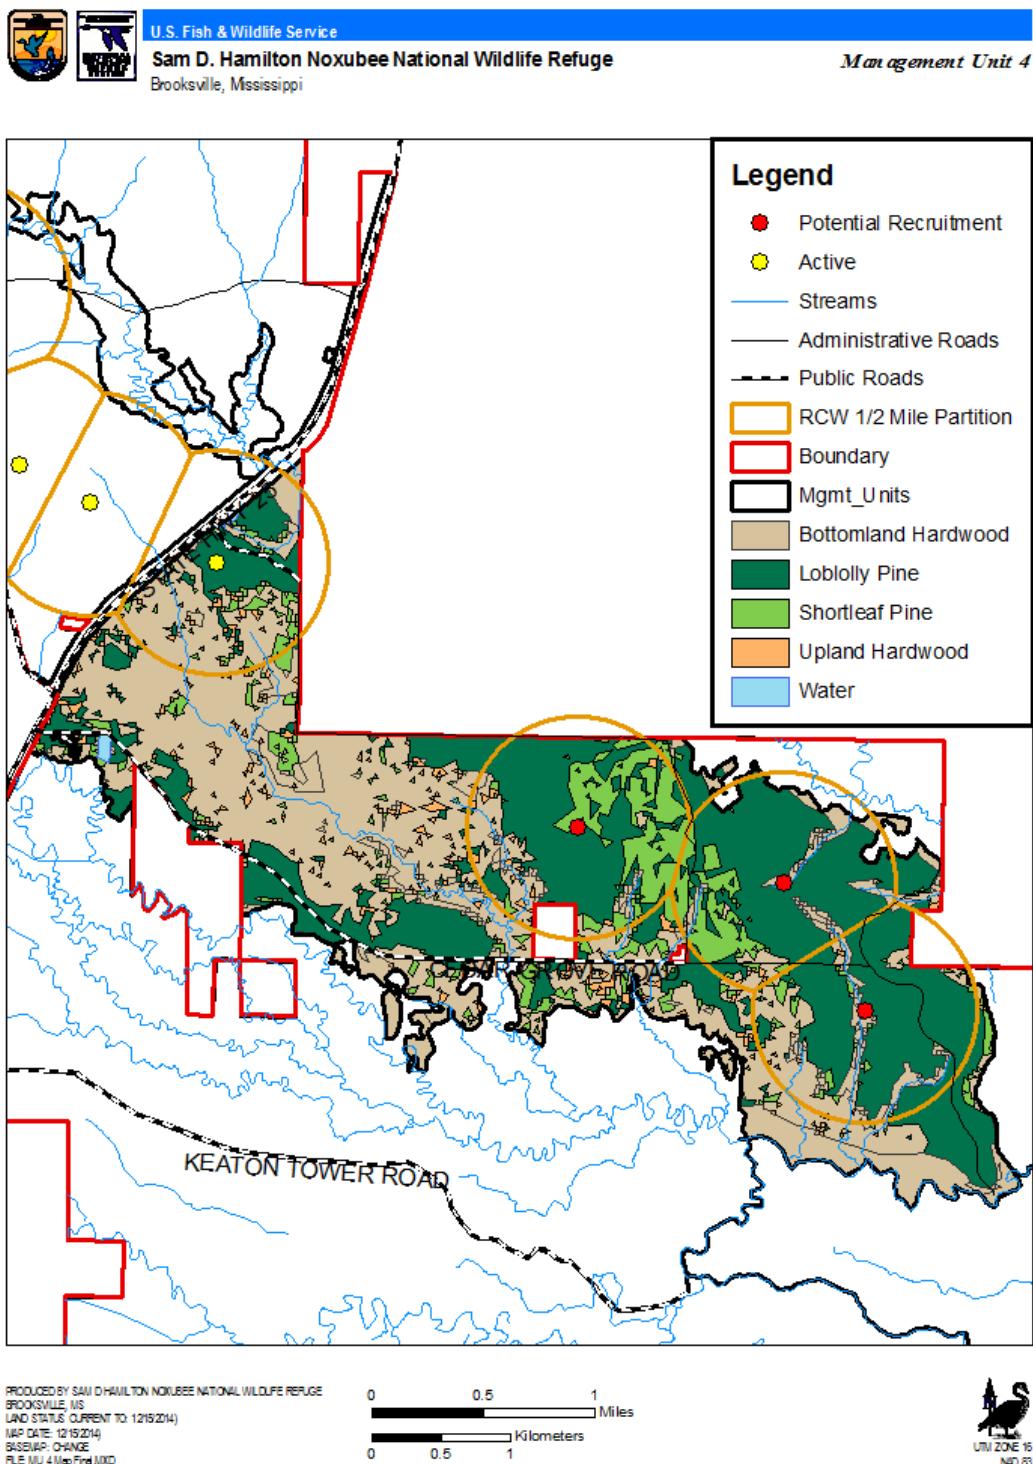

Open public and administrative roads within the unit may be maintained in a graveled state from ditch to ditch and will receive maintenance related activity throughout the year. Starting at the outside of the ditches, habitat will be maintained in the same manner as within the main unit. Vegetative barriers may be left along road edges to provide wildlife cover from road related disturbance and to deter road hunting activities, particularly where roads are adjacent to fields. Haul roads created to facilitate removal of timber will be abandoned, possibly replanted to forest and not maintained through time.

### **Adaptive Management Monitoring Elements:**

- Conduct RCW monitoring according to the 2003 RCW Recovery Plan.
- The primary habitat response variables will be forest overstory structure and composition, forest midstory and understory structure and bottomland hardwood forest health and productivity for wildlife as measured by forest inventory data.
- The primary wildlife response variable will be forest breeding bird species composition and abundance, using breeding landbird surveys (point counts).
- The refuge will consider herptafauna survey (according to PARC guidelines and protocol) (<http://www.parcplace.org/publications/inventory-and-monitoring-guide.html>).
- Monitor the effects of forest management activities to maintain integrity of desired species composition, habitat structure, and forest health.

---

## MANAGEMENT UNIT 4

---

**Resources of Concern:**

Red-cockaded Woodpecker

Forest Breeding Birds (surrogates: Louisiana waterthrush and Wood thrush)

**Species of Complimentary Needs:**

Wild turkey (*Meleagris gallopavo*)

White-tailed deer (*Odocoileus virginianus*)

Gray squirrel (*Sciurus carolinensis*)

Reptiles/Amphibians

Bats

Wood duck (*Aix sponsa*)

**Habitat Objectives:** 1.1, 1.2

**Current Condition and Special Considerations:**

Management Unit 4 is a 3,338-acre unit consisting of ridge line of loblolly pine along the length and around the eastern end of Cedar Grove Road. Upland hardwood stringers and stands are intermixed within the pine forest, and bottomland hardwood forest dominates the lower elevations. The management unit is bordered by bottomland hardwoods to the south and east and Mississippi State University short-rotation age pine plantations to the north. The unit is bordered by Highway 25 on the west. The management unit is dissected by existing public use roads and existing fire lines that facilitate both administrative, public access, and use of prescribed fire. Approximately 2,170 acres have been infrequently treated with prescribed fire to control hardwood midstory and understory. Chemical hardwood control occurred on 125 acres to control midstory and invasive plants. Active forest management has been conducted at the stand level. The current pine forest (based on stand inventories) consists of the following age classes: 0 – 10 years (5%, 166 acres); 11 – 20 years (2%, 70 acres); 21 – 30 years (3%, 102 acres); 31 – 40 years, (1%, 28 acres); 41 – 50 years (6%, 19 acres); 51 – 60 years, (7 %, 231 acres); 61 – 70 years (42%, 1397 acres); 71 – 80 years (19.4%, 648 acres); 81 – 90 year (8%, 272 acres); 91 – 100 years (4%, 132 acres); and 101+ years (8%, 263 acres). The most recent Red-cockaded Woodpecker Forage Habitat Analysis describes this unit of pine forest as lacking sufficient GQFH.

With the 1995 Forest Management Plan, the refuge established goals to manage the management unit and all habitats within it for RCWs and as of 2012, six clusters were established within the unit. All six clusters in this unit were artificially created. Today, only one of these clusters remains active (95), and all others considered abandoned due to hardwood encroachment. The most recent Red-cockaded Woodpecker Forage Habitat Analysis describes this unit as lacking sufficient GQFH for any of the six recorded clusters. Chemical hardwood control has been used in areas immediately around RCW clusters but not widely throughout the unit.

The current habitat condition of the management unit appears to be of consistent type with past forest prescriptions designed to favor the loblolly pine. *Lespedeza bicolor*, Japanese climbing fern (*Lygodium japonicum Thunb. Ex Murr.*), and cogon grass (*Imperata brasiliensis*) are a threat and some or all of these pests have been treated on 125 acres within this unit. River cane (*Arundinaria gigantea*) is found within this unit's low areas and streamside management zones but sparse in occurrence. Due to soil wetness throughout the unit, numerous ephemeral pools exist throughout the unit.

---

This unit serves as habitat for a suite of species desiring diverse hardwood forest structure including neotropical migratory birds, wild turkey, white-tailed deer, pileated woodpecker (*Dryocopus pileatus*), southern flying squirrel (*Glaucomys volans*), and numerous species of herpetofauna.

**Unique Characteristics:**

Management within the unit is impacted by Highway 25 and several private inholding that complicate use of prescribed fire as acceptable wind direction for smoke management is limited to a southeasterly flow. The unit contains numerous historical and archaeological sites including a Civil War Era cemetery. In addition to smoke management issues, ability to manage habitat for the RCW is impacted by placement of potential habitat along boundary lines. This management unit is in relatively close proximity to the Dorman Lake Lodge owned by Mississippi State University's College of Forest Resources and this non-refuge land has different management objectives than the refuge.

**Management Prescriptions:**

Cluster 95 remains as the sole active RCW cluster within the unit and its partition overlaps with habitat in Management Unit 4. The cluster's partition is made up of 392 total acres of which 336 acres are pine dominated habitat. This cluster is difficult to burn due to natural soil moisture and logistical problems with Highway 25 and prevailing winds for smoke management during burning season. These difficulties have led to infrequent burn rotations and high amounts of hardwoods remaining within the midstory. Up to three additional recruitment clusters could be created within this unit for a total of four total possible partitions being managed for RCW.

Habitat outside of Cluster 95 and, if determined needed for RCW, the recruitment clusters will be managed for Louisiana waterthrush and wood thrush by providing complex vertical and horizontal structure for nesting and foraging. Louisiana waterthrush, rusty blackbird, and wood thrush will serve as the surrogate species of other priority forest birds.

**Forest Management**

Group tree selection and free thinning could be used to create canopy gaps to promote forest structure and an intermixed forest with dominate, shade-intolerant trees with expansive, long-limbed crowns that overtop large, individual, shade tolerant trees. Canebrakes will be encouraged to develop within canopy gaps.

During the next 15-year period, the majority of the areas outside Cluster 95 will likely be allowed to follow natural successional patterns with active management focused on exotic plant control. With time, the likely silvicultural method to be used in this habitat management will be free-thinning to reduce basal area and increase desired species composition within the forest. WSI practices will also be used to manage habitat to reach the desired habitat conditions. Regardless of method and timing of active management, the goal is to promote forest diversity and health that resemble historic conditions indicated by the NatureServe (Nature Serve 2011) terrestrial ecological systems. The criteria for attaining these conditions will be based on the basal area of tree species composition being greater than 50 percent of the predominant species types according to NatureServe (Nature Serve 2011) terrestrial ecological systems. In areas of the management unit that are similar to historic conditions, current forest regeneration methods such as seed tree, shelterwood, irregular shelterwood, or groups selection may be used to sustain the habitat and historic conditions across time. In many areas, conditions are not likely to be attained during the life of this plan, but significant efforts can be made to promote these condition in habitat that have not drastically skewed from the historic conditions.

---

Habitat within the partitions managed for RCW will be directed toward providing at least 120 acres of GQFH as defined by the Red-cockaded Woodpecker Recovery Plan. Individual hardwood trees having particular wildlife value (i.e., den trees, cavity trees, and other unique characters) may be left growing throughout the pine dominated areas but canopy hardwoods will be kept to below 30 percent of canopy.

Free thinning along with chemical treatments and prescribed fire will be used to provide GQFH within a minimum of 120 acres of mature pine forest within the cluster. No silvicultural regeneration treatments for pine will occur within the partition except when promoting historical forest conditions. No new recruitment clusters will be formed and all abandoned clusters will be managed for historic habitat conditions.

Natural fire breaks will be favored to minimize the amount of artificial fire breaks installed or maintained between management units. Existing fire lines near the active clusters will be maintained to contain fire and new lines will be established if needed for the same purpose. If Cluster 95 becomes abandoned, management focus would change to that similar for recruitment clusters to favor forest breeding birds similar to that of the surrounding habitat unless determined necessary for RCW management.

### **Aquatic Management**

SMZs will be protected based on stream order and the minimums defined previously. Prescribed fire will normally be allowed to burn into SMZs with site conditions (e.g., wetness) dictating burn extent into the zone. Fire will be excluded from SMZs when habitat conditions indicate impacts to regeneration, mortality of canopy trees, and increased soil erosion. Timber management may occur within the SMZs under guidelines within Mississippi's Best Management Practices for Forestry (2008), if needed to maintain the desired forest conditions. Beaver ponds will be allowed to form naturally within the creek channels to benefit wood ducks, but beaver population and dam control actions will be used to keep beaver activity confined to the channels. All water managed by beavers that impact live timber during the growing season will be removed and when needed beaver numbers controlled.

### **Administrative Use Lands**

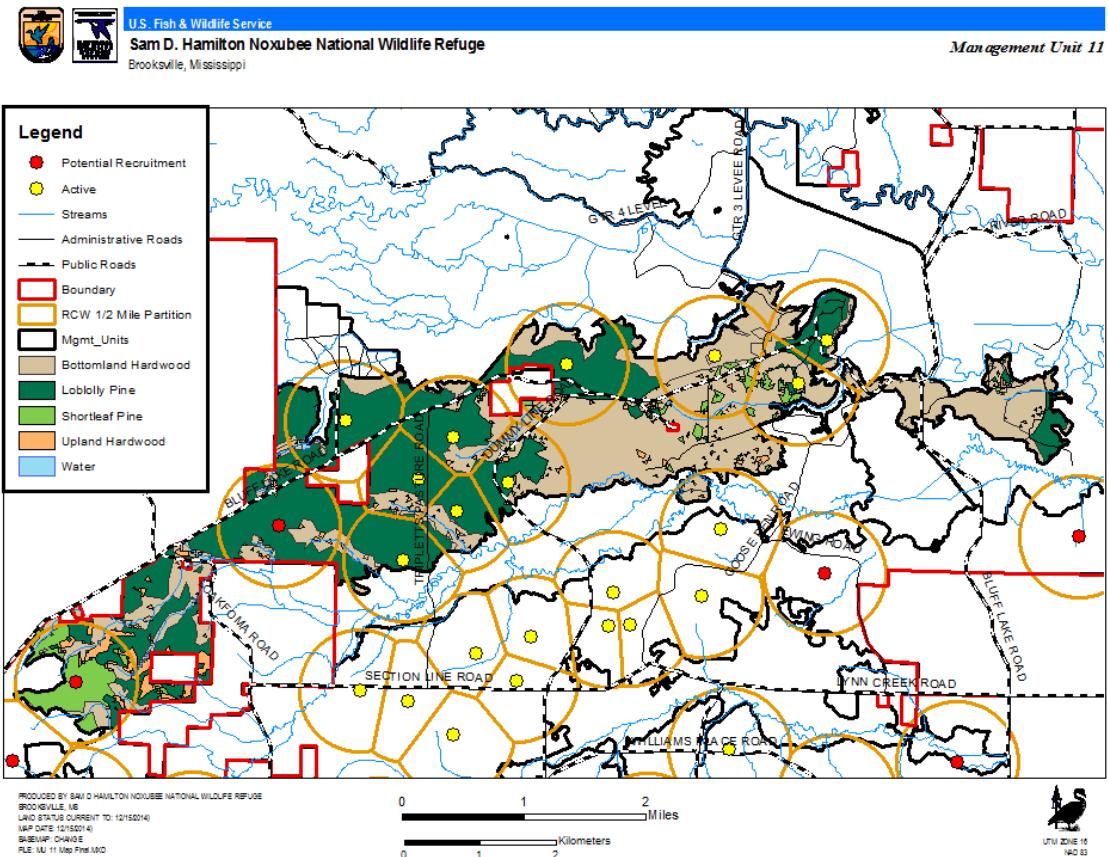

Open public and administrative roads within the unit may be maintained in a graveled state from ditch to ditch and will receive maintenance related activity throughout the year. Starting at the outside of the ditches, habitat will be maintained in the same manner as within the main unit. Vegetative barriers may be left along road edges to provide wildlife cover from road related disturbance and to deter road hunting activities, particularly where roads are adjacent to fields. Haul roads created to facilitate removal of timber will be abandoned, possibly replanted to forest and not maintained through time.

### **Adaptive Management Monitoring Elements:**

- The primary habitat response variables will be forest overstory structure and composition, forest midstory and understory structure and bottomland hardwood forest health and productivity for wildlife as measured by forest inventory data.
- The primary wildlife response variable will be forest breeding bird species composition and abundance using breeding landbird surveys (point counts).
- The refuge will consider herptafauna survey (according to PARC guidelines and protocol) (<http://www.parcplace.org/publications/inventory-and-monitoring-guide.html>).
- The refuge will consider water quality sampling on an annual schedule within the unit.
- Monitor the effects of forest management activities to maintain integrity of desired species composition, habitat structure, and forest health.

---

## MANAGEMENT UNIT 11 (Bluff Lake Road Unit)

Resources of Concern:  
Red-cockaded Woodpecker (*Picoides borealis*)

Species of Complimentary Needs:

Wild turkey (*Meleagris gallopavo*)  
Northern bobwhite (*Colinus virginianus*)  
Bachman's sparrow (*Aimophila aestivalis*)  
Brown-headed nuthatch (*Sitta pusilla*)

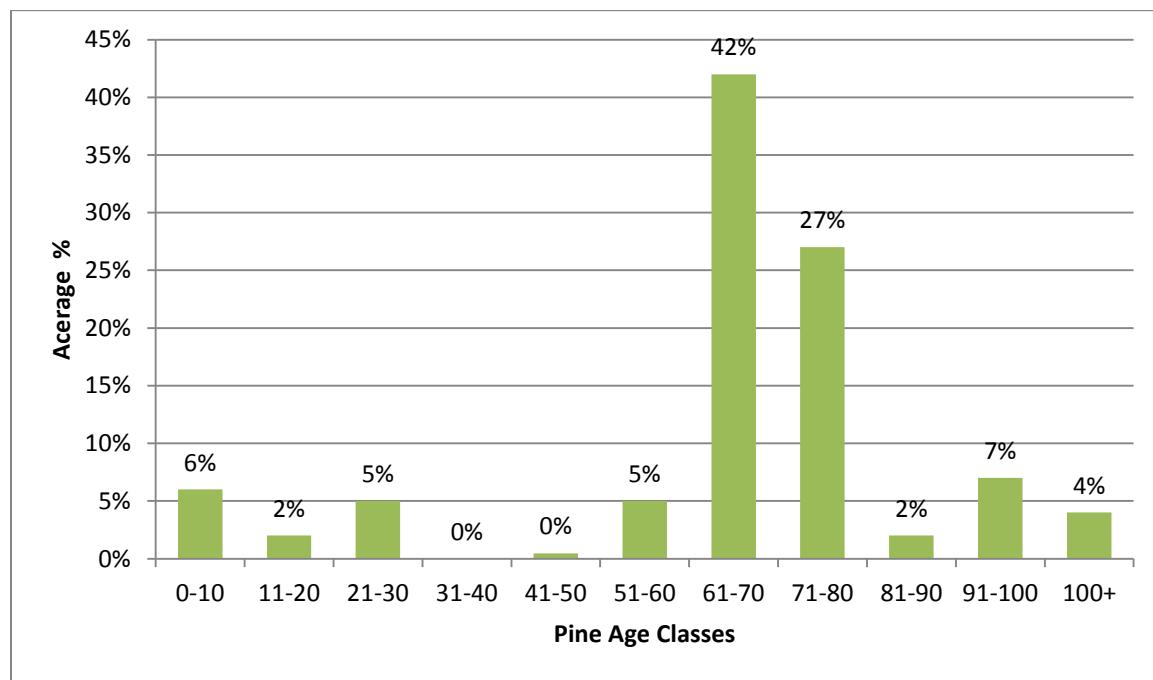

Habitat Objective: 1.1

Current Condition along with Special Considerations:

Management Unit 11 is a 5,190-acre management unit consisting predominantly of loblolly pine in the interior flatwoods and bottomland hardwoods in lower elevations. From 2010 to 2012, a total of 2,096 acres were burned. Overtime, 60 percent of the area has been treated to control hardwood midstory. Chemical control occurred on over 633 acres to control midstory.

Throughout the history of the refuge, active forest management started with plantings of trees in the late 1940s as part of stand level restoration activities. Less than 25 percent of the forest within the management unit is less than 60 years old. The majority of the pine forest consists of 60 to 80 year old trees (Figure 10).

Historic habitat analysis for this unit indicates the area as having pine habitat type (LANDFIRE) and the current condition is consistent with this description. Areas that are not predominantly pine spp. may be managed as hardwood stand to mimic historic conditions. *Lespedeza bicolor*, Japanese climbing fern (*Lygodium japonicum*), and cogon grass (*Imperata brasiliensis*) are threats and some or all of these pests have been treated on 60 acres within this unit. Several private inholdings exist in the interior of the management unit along Bluff Lake Road and the 16th Section School Board Property, and other various landowners on the south border. The area also contains several out of condition hay fields that are occasionally mowed or disked every few years, but all fields show signs of regeneration into forest with significant sweet gum (*Liquidambar styraciflua*) and loblolly pine (*Pinus taeda*) establishment. The original management intended for these fields was to provide habitat for wild turkey and northern bobwhite.

Age class distribution for pine within Management Unit 11 as determined by stand inventories, 2012

---

The unit contains first and second order streams. SMZs within Management Unit 11 consist of the red oak type. These areas have been included previously in forest management and protected following Mississippi's Best Management Practices for Forestry (2008). Numerous small perennial and intermittent streams along with drains are distributed throughout the unit. River cane is found within these zones and well distributed but sparse in occurrence. A shift in community type from pine to hardwood occurs in these areas. Due to the increased soil wetness, prescribed fire carries less readily and hardwood regeneration occurs more readily. These zones provide habitat components for a suite of species including wild turkey, white-tailed deer, pileated woodpecker (*Dryocopus pileatus*), southern flying squirrel (*Glaucomys volans*) and numerous species of herpetofauna. These hardwood SMZs will be protected from commercial logging disturbance based on the standards exceeding the Mississippi Best Management Practices document but prescribed fire will be allowed to enter these zones. There may be areas where unusual or rare plant communities are encountered within the management unit that need to be protected from disturbance.

With the 1995 Forest Management Plan, the refuge established goals to manage the management unit and all habitats within it for RCWs and as of 2012, nineteen clusters were established within the unit. Of these nineteen clusters, twelve were natural starts with the others being artificially created. Today, ten of these clusters contain RCW groups and all other clusters are considered abandoned. The most recent Red-cockaded Woodpecker Forage Habitat Analysis demonstrated this unit as lacking sufficient GQFH for any of the remaining group's partitions. Chemical hardwood control has been used in areas immediately around RCW clusters but not widely throughout the unit. All the cluster partitions described below are not meeting GQFH criterion due to presence of hardwood midstory greater than 7 feet tall, pine basal area greater than 80 square feet per acre, and groundcover being comprised of less than 40 percent herbaceous cover. Also some of these cluster partitions cannot meet sustainable GQFH goals due to acreage constraints based on available pine acres. The only criteria that the partitions currently meet are at least 18-stem-per-acre of pine greater than 14 inches diameter at breast height that are greater than 60 years of age and prescribed fire interval of less than 5 years carried by fuels other than herbaceous ground cover.

**Cluster 14** – This 385-acre partition is on a peninsula bordered by Bluff Lake to the north, east and along part of its western edge. The partition is compressed and unable to reach its full acreage of 502 acres due to the proximity of Cluster 13. The 342-acre Cluster 13 partition makes up most of the western and southern boundary to Cluster 14. Under its current configuration, Cluster 14 can provide a maximum of 137 acres (36 percent) of pine habitat within its compressed boundary. The remaining 248 acres within the foraging partition are not of historic pine type and currently consist of open water, agricultural fields, and bottomland hardwood habitats.

**Cluster 13** – This cluster is bordered by Cluster 14 to the north, Doyle Arm of Bluff Lake to east, and Cluster 104 to the west. Due to this location, the foraging partition is compressed and contains 342 acres. In addition, the lake's water body extends into the partition as well. The remaining acres consist of water, fields, and bottomland hardwoods. Currently, Cluster 13 provides 161 acres (47 percent) of pine habitat, falls under the 200-acre minimum needed to sustain GQFH.

**Cluster 104** – This 459-acre partition is bordered on the east with Cluster 13. This cluster does not border any additional clusters to the south or the west. Currently, Cluster 104 contains 299 acres (60 percent) of pine habitat within the partition. The remaining acreage consists of wetlands, water, fields, and bottomland hardwoods.

---

**Cluster 6** – This cluster is bordered by Cluster 19 to the northwest and Cluster 123 to the northeast. The cluster partition is made up of 408 total acres and 191 (47 percent) of the 408 acres are pine dominated habitat.

**Cluster 123** – This cluster is bordered by Cluster 19 to the northwest, Cluster 15 to the north, Cluster 107 to the northeast, and Cluster 6 to the southwest. The cluster partition is made up of 225 total acres and 166 (74 percent) of the 225 acres are pine dominated habitat.

**Cluster 107** – This cluster is bordered by inactive Cluster 119 to the north, Cluster 15 to the northwest, Cluster 123 to the southwest. The cluster partition is made up of 350 total acres and 192 (55 percent) of the 350 acres are pine dominated habitat.

**Cluster 19** – This cluster is bordered by Cluster 103 to the northwest, Cluster 15 to the northeast, Cluster 123 to the southeast, and Cluster 6 to the south. The cluster partition is made up of 222 total acres and 221 (99 percent) of the 222 acres are pine dominated habitat.

**Cluster 15** – This cluster is bordered by Cluster 103 to the west, Cluster 107 to the east, Cluster 123 to the south, and Cluster 19 to the southwest. The cluster partition is made up of 305 total acres and 274 (90 percent) of the 305 acres are pine dominated habitat. This cluster does have enough acres to sustain GQFH.

**Cluster 103** – This cluster is bordered by Cluster 15 to the east and Cluster 19 to the southeast. The cluster partition is made up of 380 total acres and 320 (84 percent) of the 380 acres are pine dominated habitat. This cluster does have enough acres to sustain GQFH for the life of the cluster.

**Cluster 126** – This cluster is bordered by Cluster 15 to the east and Cluster 19 to the southeast. The cluster partition is made up of 451 total acres and 254 (56 percent) of the 451 acres are pine dominated habitat.

**Cluster 119 (inactive)** – This cluster will continue to be managed for inactive cluster as per the RCW Recovery Plan. This cluster will not be used for a recruitment site as it does not provide adequate pine acres for a recruitment site. This cluster area will be utilized by Cluster 126, 15, and 107.

**Unique Features:**

Several private and public inholdings are located within this unit. There are numerous historical sites including old home sites, cisterns, and remnants of the Historic Robinson Road. The management unit also contains all of the refuge offices, shops, fire tower, compounds, and residences. The area known as Douglas Bluff is a unique geological area in the unit that contains an abrupt shift in elevation from the interior flatwoods into a bottomland hardwood ecosystem.

**Management Prescriptions:**

---

Habitat within Management Unit 11 will be primarily directed toward providing for the needs of the federally listed RCW. A total of 11 partitions, including the ten currently active and one potential recruitment partition, may be managed within this unit. The site index for both pine and hardwood tree species within this unit is more than 60. In areas outside the locations defined as SMZs, the forest will be managed toward providing at least 120 acres of GQFH per RCW group, as defined by the Red-cockaded Woodpecker Recovery Plan (Table 2). Individual hardwood trees having particular wildlife value (i.e., den trees, cavity trees, and other unique characters) may be left growing throughout the pine dominated forest but canopy hardwoods will be kept to below 30 percent of canopy.

### **Forest Management**

To accomplish the habitat management objectives for RCW within this unit, it will be necessary to manage clusters and their locations to provide a target 300 acres of pine habitat per cluster to sustain a perpetual 120 acres of GQFH of pine for RCWs.

**Cluster 14** – The pine forested area of this cluster does not provide the 300-acre minimum needed to sustain GQFH into the long-term future (2003 RCW Recovery Plan). Left under its current condition, this cluster may at best be managed for GQFH for no more than another 50 years. Within the near future, the forest within this cluster can be expected to degrade and eventually not provide habitat for the RCW. Once the pine habitat degrades, it will be approximately 30 years before a regenerated pine forest will be able to again provide foraging habitat. Until a long-term solution can be realized that would allow for an increase of pine acres, management efforts will be to provide the best foraging habitat possible within 120 acres through control of midstory vegetation and protection of nesting and roosting trees from bug outbreaks. Regeneration within the remaining 17 acres of pine would occur toward meeting longer term habitat needs. Given the limited number of pine acres, the selected method for regeneration should be one that best retains overstory as foraging habitat while growing young pine within the understory (a two-aged strategy), therefore allowing for a future site of pine for foraging without overly impacting the birds' present needs for mature pines. This strategy is challenging to apply successfully and may require extensive use of herbicides to control competing hardwoods and intensive tree individual tree management. This two-aged strategy may extend the lifespan of this individual cluster, but will do little to sustain the cluster indefinitely since its long-term problem is lack of space.

The planned long-term approach for this cluster will be to combine the partition to that of the adjoining Cluster 13 to support one cluster with a minimum of 300 to potentially support perpetual GQFH. Although not immediately possible since both clusters are currently active, this combined partition would provide ample acreage of pine habitat within which 120 acres of foraging habitat could be provided and additional pine acres could be used to regenerate pine for use as future GQFH. This long-term strategy may require more than 60 years before reaching fruition and depends on one or the other cluster becoming inactive.

**Cluster 13** – This cluster contains approximately 60 acres of fields that will be afforested to pine habitat that will bring the total pine acreage to approximately 220 pine acres (64 percent) within the partition. Approximately 41 acres of mature pine could be managed for regeneration of pine within the current partition, with 120 acres being managed toward GQFH. The preferred long-term approach for this cluster will be to combine the partition to that of the adjoining Cluster 14 to support one cluster with a minimum of 300 to potentially support perpetual GQFH. Although not immediately possible since both clusters are currently active, this combined partition would provide ample acreage of pine habitat within which 120 acres of foraging habitat could be provided. This long-term strategy may require more than 60 years before reaching fruition.

---

**Cluster 104** – With a minor shift in the cluster of 0.125-mile to the west, the partition could add 80 acres of pine habitat. This shift would also allow more pine acres to be added to the future combined cluster created by the merge of Clusters 13 and 14. Afforestation of the 17-acre field would also provide additional pine habitat. These changes would increase pine habitat to approximately 400 acres within the partition. A total of 120 acres of mature pine forest within Cluster 104 will need treatment to reduce basal area and midstory to strive for GQFH. The targeted location for treatment would from Griffen Slough north to the bottomland hardwood stand and from Griffen Slough south down to south end of the partition and east of Smith Fields Road. Portions of the partition not needed to meet current GQFH needs will be managed for regeneration of pine.

**Cluster 6** – This partition also has 50 acres of fields that can be converted to pine acres, thus increasing total pine acres for this partition to 241. Once these fields are regenerated, the cluster will not provide ample acres to support GQFH. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to meet GQFH. This cluster could have approximately 121 acres of mature pine forest to be regenerated for future GQFH.

**Cluster 123** – Over a 60-year period, this cluster will gain acreage (up to 80 acres) from Cluster 107 shifting to the north approximately 0.25-mile, and Cluster 15 shifting to the northeast approximately 0.25-mile to allow Cluster 123 more partition acres. With the shift, this cluster would provide ample acres to support management toward GQFH for the life of the cluster. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 105 acres of mature pine forest to be regenerated for use as future GQFH.

**Cluster 107** – This cluster needs to shift slightly (0.125-mile) to the north/northeast to maximize its pine acres within a partition and allow surrounding clusters to gain pine acres. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 350 acres of mature pine forest within the partition to be used toward regeneration of pine for providing GQFH into the future.

**Cluster 19** – This cluster does not have enough acres to sustain GQFH and would benefit from a shift of Cluster 15 and 107 to the north/northeast. This would provide more acreage for this cluster, but may never meet the minimum acreage needed to sustain GQFH. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster needs approximately 101 acres of mature pine forest within the partition that could be used to regenerate pine for future GQFH.

**Cluster 15** – A shift to the north/northeast would benefit this cluster and clusters 107, 123, 19, and 6. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 154 acres of mature pine forest within this partition that can be regenerated for future GQFH.

---

**Cluster 103** – This cluster does have enough acres to sustain GQFH for the life of the cluster. Although this cluster does currently have the pine acres to support GQFH, this cluster and surrounding clusters could benefit from a slight shift to the west, 0.125- to 0.25-mile would increase pine acreage within the partition. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to meet GQFH. This cluster has approximately 200 acres of mature pine forest within the partition that can be regenerated for providing GQFH into the future.

**Cluster 126** – Although this cluster does currently have the pine acres to support GQFH, it would benefit from a slight shift to the east. A shift of 0.125- to 0.25-mile would increase pine acreage within the partition and create a greater distance from private land and allow more acreage for clusters 15 and 107 as they shift to the north/northeast. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to meet GQFH. This cluster currently has 134 acres of mature pine forest within the partition available for regeneration to provide future GQFH.

**Cluster 119 (inactive)** – This cluster will continue to be managed as an inactive cluster as per the RCW Recovery Plan. This cluster will not be used for a recruitment site as it does not provide adequate pine acres for a recruitment site. This cluster area will be utilized to improve clusters 126, 15, and 107.

Any future recruitment cluster established within this unit will need contain at least 300 acres of pine habitat. A minimum of 120 acres of mature pine forest within the recruitment cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. Mature pine forest located outside of the 120 acres needed for GQFH may be used toward regeneration of pine for providing GQFH into the future.

The use of free-thinnings, pre-commercial thinnings, and WSI methods will be tools in managing the forest to meet the habitat criteria for RCW. The most common silvicultural method, free-thinning, will be used to reduce pine basal area and remove hardwood midstory trees to improve GQFH. WSI practices will also be used to manage tree species diversity to reach the desired habitat conditions for areas not suitable for commercial harvest. Other methods may be used to remove unwanted understory or to reduce basal within stands, including manual or mechanized pre-commercial thinning, commercial biomass thinning, mulching, or permitted firewood cutting of hardwoods. Alone or in combination, prescribed fire, mechanical control methods, and use of herbicides may be widely used to control hardwood growth and create the desired understory and ground characteristics needed to produce insects for use by the woodpeckers. Regardless of method, the goal would be to promote GQFH in stands that have become over stocked with trees or contain high amounts of hardwoods within the midstory component.

Irregular shelterwood silvicultural techniques will be used for regeneration of the forest within the partitions where the foraging habitats are constrained (i.e., proximity to other partition, acreage, and potential dispersal corridors). Irregular shelterwood will minimize foraging habitat fragmentation, allow for the residual stem to be available for future cavity trees and provide an age structure that could expedite potential suitable GQFH in the regenerated stand.

---

Thinning, irregular shelterwood, or seedtree may be used in stands of habitat within Management Unit 11 that is currently mixed pine-hardwood to promote a greater pine component. In areas where the habitat constraints mentioned above are not present, the use of shelterwood, irregular shelterwood, seedtree harvest, patch cuts, afforestation, and reforestation may all be viable options to promote a sustainable pine-hardwood forest habitat. The exact regeneration methods used will be site and habitat condition-specific based on observed site conditions and proximate location to the existing GQFH within the partition.

Existing fire lines will be maintained to contain fire and new lines will be established to protect regenerating tree species. Natural fire breaks and use of temporary hand-lines will be favored to minimize the amount of artificial fire breaks installed or maintained between forest stands. All decisions on location, frequency, and intensity of treatments will be determined by habitat condition and needs of the RCW for foraging habitat. Administrative utility terrain vehicle (UTV) trails may be improved to prevent soil erosion and protect water quality. Improvements may include use of erosion control fabric, gravel, and small bridges.

### **Aquatic Management**

Soils and waterways within SMZs will be protected based on stream order as described previously. Prescribed fire will normally be allowed to burn into SMZs with site conditions (e.g., wetness) dictating burn extent into the zone. Fire may be excluded from SMZs when habitat conditions indicate impacts to regeneration, mortality of canopy trees, and increased soil erosion. Timber management may occur within the SMZs under guidelines within Mississippi's Best Management Practices for Forestry (2008), if needed to maintain the desired forest conditions.

### **Open Land Management**

All old field locations determined to be needed for RCW management within Management Unit 11 will be reforested in pine species (i.e., loblolly, short-leaf pine, and long-leaf pine) that best represent historical forest and site conditions and facilitate the management of the habitat for RCWs. Seedlings will be planted using either natural reseeding or manual replanting of seedlings. These same species and techniques may also be used to regenerate damaged habitats within forest openings such as those caused by southern pine beetle, ips, or storms. All habitat management activity will occur when site and species conditions are favorable for the management activity to happen, and minimally impact the habitat or resource of concern. The forest management operations within RCW areas will adhere to the RCW Recovery Plan Guidelines.

### **Administrative Land Management**

Open public and administrative roads within the unit may be maintained in a graveled state from ditch to ditch and will receive maintenance related activity throughout the year. Starting at the outside of the ditches, habitat will be maintained in the same manner as within the main unit. Vegetative barriers may be left along road edges to provide wildlife cover from road related disturbance and to deter road hunting activities, particularly where roads are adjacent to fields. Sections of the Old Robinson Road that are visible should be protected from disturbance, to maintain the integrity of the old road bed. Areas around the immediate infrastructure of the shop, residences, and office will be maintained to be presentable to the public. Haul roads created to facilitate removal of timber will be abandoned, possibly replanted to forest and not maintained through time. Administrative UTV access trails may be needed to be created to facilitate the monitoring of birds at individual cluster locations. These trails will not be highly developed but may be improved to provide year-round UTV access without damage to soil or water quality.

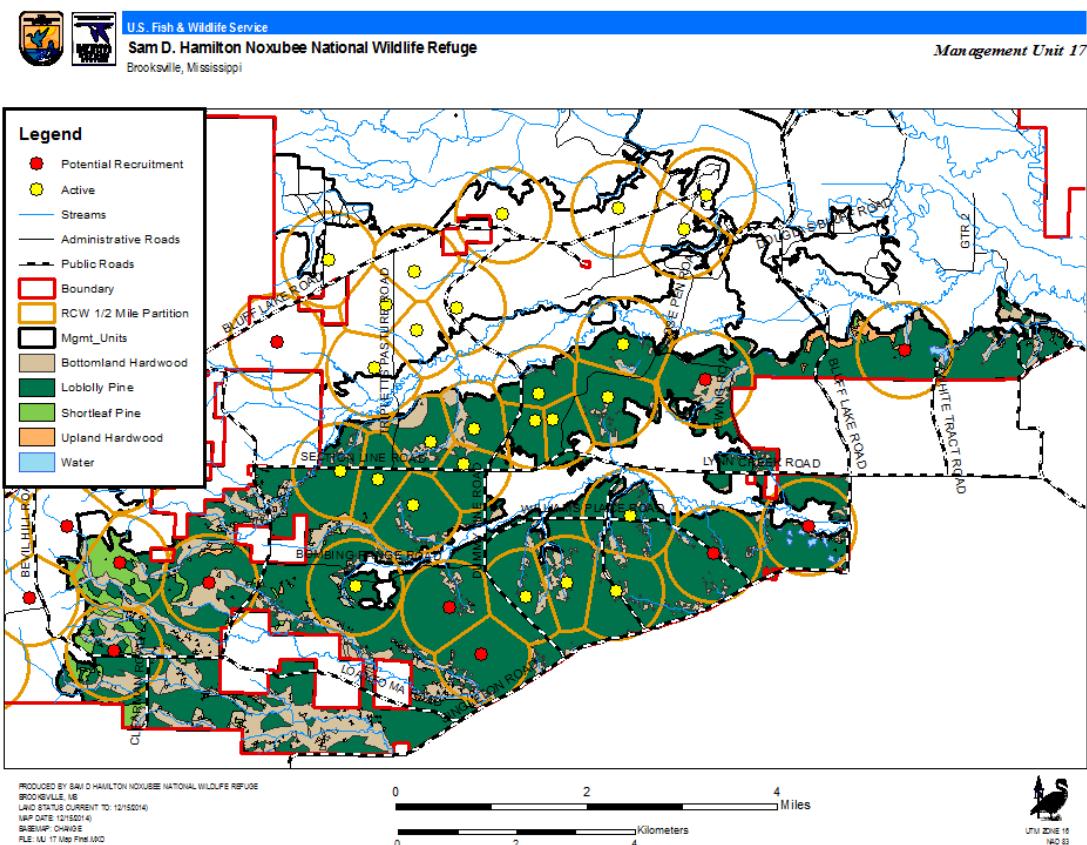

---

**Adaptive Management Monitoring Elements:**

- Conduct RCW monitoring according to the 2003 RCW Recovery Plan.
- The primary habitat response variables will be forest overstory structure and composition, forest midstory and understory structure, and productivity for wildlife as measured by forest inventory data.
- The primary wildlife response variable will be forest breeding bird species composition and abundance using breeding landbird surveys (point counts).
- The refuge will consider herptafauna survey (according to PARC guidelines and protocol) (<http://www.parcplace.org/publications/inventory-and-monitoring-guide.html>).
- Monitor the effects of forest management activities to maintain integrity of desired species composition, habitat structure, and forest health.

---

**MANAGEMENT UNIT 17**  
**(Section Line Road Unit)**

**Resources of Concern:**  
Red-cockaded Woodpecker (*Picoides borealis*)

**Species of Complimentary Needs:**

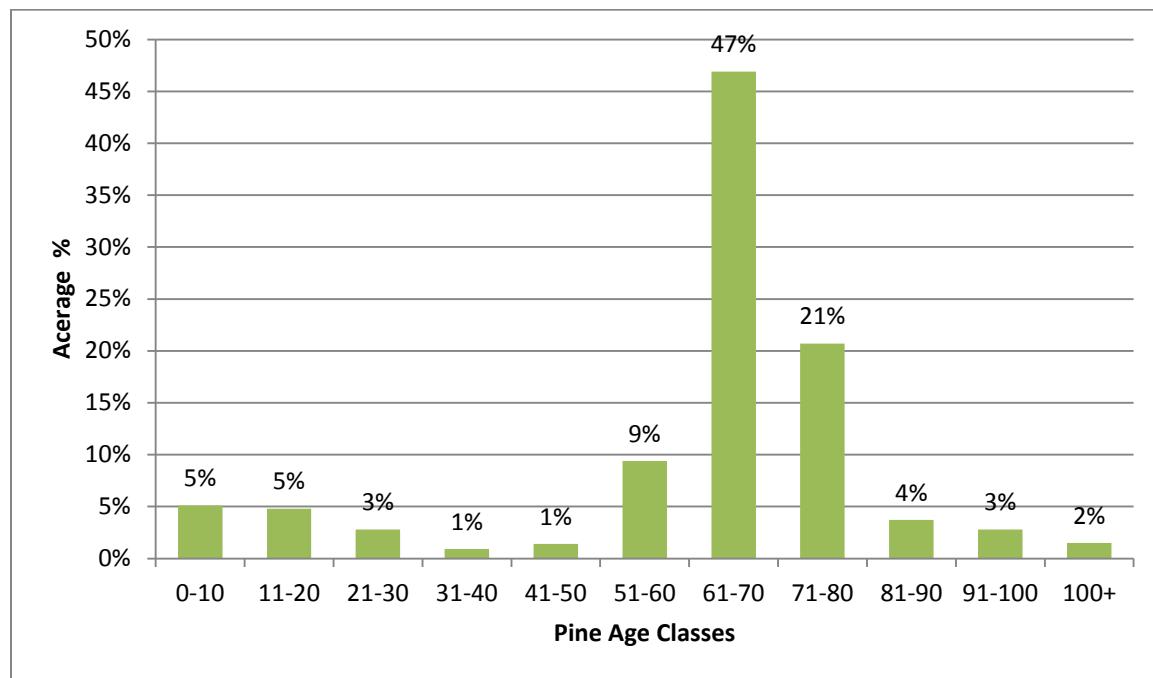

Wild turkey (*Meleagris gallopavo*)  
Northern bobwhite (*Colinus virginianus*)  
Bachman's sparrow (*Aimophila aestivalis*)  
Brown-headed nuthatch (*Sitta pusilla*)

**Habitat Objectives:** 1.1, 1.2

---

#### Current Condition and Special Considerations:

Management Unit 17 consists primarily of loblolly pine with numerous streamside management zones and is partially bisected by a red oak hardwood bottom (Management Unit 18). From 2010 to 2013, approximately 15,331 acres were treated with prescribed fire equating to more than 60 percent of the area. Over this same time period, herbicides were used on more than 633 acres to control hardwoods in the midstory. Within the unit are three small (<3-acre) research demonstration plots where midstory hardwoods were either left untreated, treated with prescribed fire, or treated with herbicides. Although there is no formal study design associated with these plots, these plots are frequented by educational groups interested in understanding the influence of fire on forested habitat. The management unit is bounded and dissected by refuge public use roads and maintained fire lines. Throughout the history of the refuge, active forest management started with plantings of trees in the late 1940s as part of stand level restoration activities. Less than 25 percent of the forest within the management unit is less than 60 years old. The majority of the pine forest are 60 to 80 years of age (Figure 11).

Age class distribution for pine within Management Unit 17 as determined by stand inventories, 2012.

Historic habitat analysis for this unit indicates the area as having the potential pine habitat type (LANDFIRE) and current conditions are similar. *Lespedeza bicolor*, Japanese climbing fern (*Lygodium japonicum Thunb. Ex Murr.*), and cogon grass (*Imperata brasiliensis*) are a threat and some or all of these pests have been treated on 93 acres within this unit. Several large private inholdings exist at the western end of the unit, causing some fragmentation of pine habitat. The area also contains several refuge managed out-of-condition hay fields mowed or disked every few years. Today, all these fields show signs of regeneration into forest with significant sweet gum (*Liquidambar styraciflua*) growth. The original management intent for the fields was to provide habitat for wild turkey and northern bobwhite.

---

The unit contains first, second, and third order streams. The habitat along these SMZs within Management Unit 17 consists of the red oak type. These areas have been included previously in various levels of forest management but remained protected following Mississippi's Best Management Practices for Forestry (2008). Yellow Creek, Horse Creek, and the upper fingers of Loakfoma Creek are named creeks within this unit. Numerous other small perennial and intermittent streams along with drains are distributed throughout the unit. River cane is associated within these zones and well distributed but sparse in occurrence. Within these SMZs, a shift in community type from pine to hardwood occurs. Pine is frequently represented within the overstory within these zones due to the increased soil wetness, prescribed fire carries less readily, and hardwood regeneration occurs more readily and prevents these areas from becoming a pine dominated stand. These irregular zones provide habitat components for a suite of species including wild turkey, white-tailed deer, pileated woodpecker (*Dryocopus pileatus*), southern flying squirrel (*Glaucomys volans*), and numerous species of herpetofauna.

Within the 1995 Forest Management Plan, the refuge established goals to manage this management unit and all habitats within it for RCW. As of 2012, twenty four clusters were established within the unit. Of these 24 clusters, 10 clusters were natural starts with the other 14 being artificially created by staff. Today, 16 of the 24 clusters remain active. A seventeenth cluster has been inactive for less than 5 years and the remaining seven clusters are considered abandoned and no longer viable RCW clusters. The most recent examination of habitat for the 17 clusters reveals each is lacking sufficient GQFH. All the cluster partitions listed below are not meeting GQFH criterion due to presence and abundance hardwood midstory greater than 7 feet tall, pine basal area greater than 80 square feet per acre, and groundcover being comprised of less than 40 herbaceous cover. Also some of these cluster partitions cannot meet GQFH due to current acreage constraints based on available pine acres. The only criteria that the partitions currently meet is at least 18 stems per acre of pine greater than the 14 inches DBH that are greater than 60 years of age and prescribed fire interval of less than 5 years carried by fuels other than herbaceous ground cover.

**Cluster 94** - This cluster is bordered by Cluster 23 to the east. The cluster partition is made up of 390 acres. A total of 315 (81 percent) of the 390 acres is pine dominated habitat.

**Cluster 23** - This cluster is bordered by Cluster 112 to the east, Cluster 94 to the west, and recruitment cluster 118 to the north. The cluster partition is made up of 273 total acres and 262 (96 percent) of the 273 acres are pine dominated habitat.

**Cluster 112** - This cluster is bordered by Cluster 117 to the north and Cluster 23 to the west. The cluster partition is made up of 381 total acres and 381 (100 percent) of the 381 acres are pine dominated habitat.

**Cluster 117** - This cluster is bordered by Cluster 112 to the south and recruitment Cluster 118 to the west. The cluster partition is made up of 368 total acres and 280 (76 percent) of the 368 acres are pine dominated habitat.

**Cluster 118 (recruitment)** - This cluster is bordered by Cluster 23 to the south and recruitment Cluster 117 to the east. The cluster partition is made up of 365 total acres and 209 of the 365 acres are pine dominated habitat.

**Cluster 27** - This cluster is bordered by Cluster 110 to the east, Cluster 37 to the northeast, Cluster 114 to the south, and Cluster 7 to the west. The cluster partition is made up of 258 total acres and 214 of the 258 acres are pine dominated habitat

---

**Cluster 7** - This cluster is bordered by Cluster 27 to the northeast, Cluster 114 to the southeast, Cluster 100 to the south, and Cluster 8 to the southwest. The cluster partition is totals 268 total acres and 203 (76 percent) of the 268 acres are pine dominated habitat.

**Cluster 114** - This cluster is bordered by Cluster 27 to the north, Cluster 7 to the south, and Cluster 100 to the southwest. The cluster partition is made up of 257 total acres and 214 (83 percent) of the 257 acres are pine dominated habitat.

**Cluster 100** - This cluster is bordered by Cluster 7 to the north, Cluster 114 to the northeast, and Cluster 8 to the northwest. The cluster partition is made up of 335 total acres and 331 (99 percent) of the 335 acres are pine dominated habitat.

**Cluster 8** - This cluster is bordered by Cluster 7 to the northeast, Cluster 100 to the southeast, and Cluster 113 to the west. The cluster partition is made up of 233 total acres and 216 (93 percent) of the 233 acres are pine dominated habitat.

**Cluster 113** - This cluster is bordered by Cluster 8 to the east. The cluster partition is made up of 326 total acres and 275 (84 percent) of the 326 acres are pine dominated habitat.

**Cluster 122** - This cluster is bordered by recruitment Cluster 88 to the west. The cluster partition is made up of 502 total acres and 418 (83 percent) of the 502 acres are pine dominated habitat

**Cluster 88 (recruitment)** - This cluster is bordered by Cluster 122 to the east. This 345-acre recruitment cluster will be moved approximately 0.25-mile to the west. At the current time, 66 percent (226 acres) of the partition is of pine habitat.

**Cluster 106** - This cluster is bordered by Cluster 116 to the south and forms a 422-acre partition. This cluster does not border any additional clusters to the north, east, or west. Currently, Cluster 106 provides 230 acres (55 percent) of pine habitat within the partition. Fields and bottomland hardwood make of the remaining acres.

**Cluster 116** - This cluster is bordered by Cluster 106 to north, Cluster 17 to the southwest, and Cluster 37 to the northwest, and is compressed to a foraging partition of 350 acres. The cluster partition is made up of 317 acres (91 percent) of pine habitat.

**Cluster 17** - This cluster is bordered by Cluster 37 to north, Cluster 116 to the east, and Cluster 110 to the west. The cluster partition totals 189 acres and 159 acres (84 percent) are pine habitat. This cluster falls below the minimum acres (200 acres) needed to support GQFH for the life of the cluster once forestry practices are implemented, but sufficient acres exist to manage the habitat for GQFH.

**Cluster 110** - This cluster is bordered by Cluster 37 to north, Cluster 17 to the east, and Cluster 27 to the west. The cluster partition totals 168 total acres and 137 acres (82 percent) are pine habitat. This cluster falls below the minimum acres (200) needed to support GQFH for the life of the cluster once forestry practices are implemented.

**Cluster 37** - This cluster is bordered by Cluster 17 to the southeast, Cluster 110 to the southwest, and Cluster 116 to the east. The cluster partition totals 279 acres and 210 acres (75 percent) are pine habitat. The remaining acres are bottomland hardwoods.

---

#### Unique Features:

Dummyline Road runs through the area perpendicular to Lynn Creek and was originally a route utilized by a railroad company for timber transport. The Morgan Hill Demonstration Prairie area, located at the unit's east end, consists of 33 acres of open field that have been managed to replicate a prairie-like condition by using fire and mechanical means. The prairie area contains 0.68-mile of walking trail and an overlook tower for use by visitors. The unit borders Loakfoma Lake to the north and west, Bluff Lake road to the east, and CA Barge Timberlands Company to the south. This area is divided by Lynn Creek, Management Unit 18. There are numerous privately owned inholdings and historical sites, including a historic World War II practice bombing range, old home sites, cisterns, and saw dust piles located within the unit. Saw dust piles and inholdings are protected from fire by fire lines. The private inholdings are mostly cleared fields, causing fragmentation of pine habitats.

#### Management Prescriptions:

Habitat within Management Unit 17 will be primarily directed toward providing for the needs of the federally listed endangered RCW. In addition to the 16 currently active partitions, up to seven recruitment clusters may be created within the unit. The site index for both pine and hardwood tree species within this unit is more than 60. The forest will be managed to provide at least 120 acres of GQFH per RCW cluster. Individual hardwood trees having particular wildlife value (i.e., den trees, cavity trees, and other unique characters) may be left growing throughout the pine dominated forest, but canopy hardwoods will be kept to below 30 percent of canopy. To accomplish the habitat management objectives for RCW within this unit, it will be necessary to manage clusters and their locations to provide a target 300 acres of sustainable pine habitat per partition.

**Cluster 94** - Over a 60-year period, this cluster will be shifted to the west approximately 0.25-mile to allow Cluster 23 more partition acres. Even with the shift, this cluster will continue to provide ample acres to perpetually support GQFH for the life of the cluster once forestry practices are implemented. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has 195 acres of mature pine forest available for regeneration to provide future GQFH.

**Cluster 23** - Over a 60-year period, this cluster will be shifted to the west approximately 0.25-mile to provide an additional 40 to 100 partition acres. Currently without the shift, this cluster does not provide ample acres to perpetually support GQFH. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 142 acres of mature pine forest within the partition for use in regenerating future GQFH.

**Cluster 112** - This cluster provides ample acres to perpetually support GQFH for the life of the cluster once forestry practices are implemented. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 261 acres of mature pine forest within the partition for use in regenerating future GQFH.

---

**Cluster 117** - This cluster does provide ample acres to perpetually support GQFH for the life of the cluster once forestry practices are implemented. A potential southeastern shift of 0.125- to 0.25-mile to the southeast over time will provide more acres for this cluster and recruitment Cluster 118. This shift will provide approximately 20-60 additional pine acres for each partition. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster currently has approximately 160 acres of mature pine forest within the partition for use in regenerating future GQFH.

**Cluster 118 (recruitment)** - This cluster has sufficient acres to be managed for GQFH within the short term. This cluster would gain additional acres once Cluster 117 shifts 0.125- to 0.25-mile to the southeast. This shift will provide approximately 20-60 additional pine acres for each partition. This cluster currently has approximately 89 acres of mature pine forest within the partition for use in regenerating future GQFH.

**Cluster 106** - The 32 acres of fields will be afforested to pine habitat increasing the pine habitat to 262 acres of pine (62 percent) with the partition. A total of 120 acres of mature pine forest within Cluster 106 will need treatment to reduce basal area and midstory to meet GQFH. This cluster has approximately 110 acres of mature pine forest within the partition for use in regenerating future GQFH. By treating the existing forest and developing a replacement forest, this partition should possess a minimum of 120 acres of potential GQFH well into the future.

**Cluster 116** - This cluster provides ample acres to perpetually support GQFH for the life of the cluster once forestry practices are implemented. A total of 120 acres of mature pine forest within Cluster 116 will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 197 acres of mature pine forest within the partition for use in regenerating future GQFH.

**Cluster 17** - This cluster falls below the minimum acres needed to perpetually support GQFH for the life of the cluster. A total of 120 acres of mature pine forest within the partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 39 acres of mature pine forest within the partition for use in regenerating future GQFH. In the long term, this cluster needs to merge with Cluster 110 and slightly shift 0.125- to 0.25-mile to the south to provide approximate partition acreage of approximately 300 acres, after merging. The combination if these clusters could eventually happen due to the lack of available foraging acres within each partition and the proximity of nest trees. These clusters nest within several hundred yards of one another and spend time and energy defending their territories.

**Cluster 110** - This cluster falls below the minimum acres needed to perpetually support GQFH for the life of the cluster. Approximately 120 acres of mature pine forest within the partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 17 acres of mature pine forest within the partition for use in regenerating future GQFH.

In the long term, this cluster needs to merge with Cluster 17 and a migration of the cluster center of 0.125- to 0.25-mile to the south over time to provide total partition acreage of approximately 300 acres of pine habitat after merging. The combination if these clusters should eventually happen due to the lack of available foraging acres within each partition and the proximity of nest trees. These clusters nest within several hundred yards of one another and spend time and energy defending their territory. By combining partitions, treating the forest and developing a replacement forest, this larger partition should possess a minimum of 120 acres of potential GQFH well into the future.

---

**Cluster 37** - This cluster falls below the minimum acres needed to perpetually support GQFH for the life of the cluster. Approximately 120 acres of mature pine forest within the partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 90 acres of mature pine forest within the partition for use in regenerating future GQFH.

In the long term, this cluster needs Clusters 17 and 110 to merge and move to the south approximately 0.125- to 0.25-mile over the next 60 years to provide total partition acreage of approximately 300 acres of pine habitat after merging. This cluster could sustain GQFH if the above mentioned goals are met, but potentially could never meet minimum needs for GQFH.

**Cluster 27** - This cluster may provide the minimum acres needed to perpetually support GQFH for the life of the cluster, but could gain acreage with the potential merger of 114 and 7. Cluster 27 could add additional 40-80 total partition acres. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 94 acres of mature pine forest within the partition for use in regenerating future GQFH. This cluster should gain acreage with the merger of the above mentioned clusters, potentially providing 120 acres of GQFH within the future partition boundary for the life of the partition.

**Cluster 7** - This cluster may provide the minimum acres needed to perpetually support GQFH for the life of the cluster, but could gain acreage with the potential merger of Cluster 114. This partition contains 55 (21 percent) acres of fields that will be regenerated for future RCW habitat and could potential gain an additional 20-60 acres of pine habitat with the shift of the westerly adjoining clusters. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. In addition to the fields, this cluster has approximately 83 acres of mature pine forest within the partition for use in regenerating future GQFH. This cluster should gain acreage with the merger and shift of the above mentioned clusters, potentially providing 120 acres of GQFH within the future partition boundary for the life of the partition.

**Cluster 114** - This cluster may provide the minimum acres needed to perpetually support GQFH for the life of the cluster, but could gain acreage with the potential merger of Cluster 7. This cluster partition has the potential to gain approximately 20 acres of pine habitat with the shift of the westerly adjoining clusters. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 94 acres of mature pine forest within the partition for use in regenerating future GQFH. This cluster should gain acreage with the merger and shift of the above mentioned clusters, potentially providing 120 acres of GQFH within the future partition boundary for the life of the partition.

**Cluster 100** - This cluster has ample pine acreage to perpetually sustain GQFH through the life of the cluster. Ideally within the next 60 years this cluster should shift slightly (0.125- to 0.25-mile) to the southwest; this would allow clusters 114 and 7 to gain approximately 20 acres each of pine habitat within the partitions. Clusters 8 and 113 would also need to slightly shift to the west/ southwest as well to optimize pine acres within all adjoining partitions (discussed in clusters 8 and 113).

---

A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 211 acres of mature pine forest within the partition for use in regenerating future GQFH.

**Cluster 8** - Ideally within the next 60 years this cluster should shift slightly (0.125- to 0.25-mile) to the west/southwest; this would allow this cluster to gain approximately 40-80 acres of pine habitat within the partition. This will be possible with the movement of Cluster 113 to the west approximately 0.25-mile to the west. Cluster 113's potential movement to the west/southwest will be the key factor to free up additional pine acres for the adjacent cluster to the east (discussed in clusters 7, 27, 100, 113 and 114).

A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 96 acres of mature pine forest within the partition for use in regenerating future GQFH.

**Cluster 113** - This cluster will have ample pine acreage to perpetually sustain GQFH through the life of the cluster if the open fields are replanted, but needs to shift slightly (0.125- to 0.25-mile) to the west/southwest to provide more acres to the chain of clusters immediately to the east. A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. This cluster has approximately 155 acres of mature pine forest within the partition for use in regenerating future GQFH.

**Cluster 122** - This cluster provides ample acres to perpetually support GQFH for the life of the cluster once forestry practices are implemented. Cluster 88 is shown on the map as taking a portion of the overall partition acreage, but since it is a recruitment site those acreages currently belong to Cluster 122. Recruitment site 88 will be moved approximately 0.25-mile to the west if not occupied, to optimize the acreage for both partitions.

A minimum of 120 acres of mature pine forest within the cluster partition will need treatment to reduce basal area and midstory to strive GQFH. This cluster has approximately 298 acres of mature pine forest within the partition for use in regenerating future GQFH.

Any future recruitment cluster established within this unit will need contain at least 300 acres of pine habitat. A minimum of 120 acres of mature pine forest within the recruitment cluster partition will need treatment to reduce basal area and midstory to strive for GQFH. Mature pine forest located outside of the 120 acres needed for GQHF may be used toward regeneration of pine for providing GQFH into the future.

The use of free-thinnings, pre-commercial thinnings, and WSI methods will be tools in managing the forest to meet the habitat criteria for RCW. The most common silvicultural method, free-thinning, will be used to reduce pine basal area and remove hardwood midstory trees to improve GQFH. WSI practices will also be used to manage tree species diversity to reach the desired habitat conditions for areas not suitable for commercial harvest. Other methods may be used to remove unwanted understory or to reduce basal within stands including manual or mechanized pre-commercial thinning, commercial biomass thinning, mulching, or permitted firewood cutting of hardwoods. Alone or in combination, prescribed fire, mechanical control methods, and use of herbicides may be widely used to control hardwood growth and create the desired understory and ground characteristics needed to produce insects for use by the woodpeckers. Regardless of the method, the goal would be to promote GQFH in stands that have become over-stocked with trees or contain high amounts of hardwoods within the midstory component.

---

Irregular shelterwood silvicultural techniques will be used for regeneration of the forest within the partitions where the foraging habitats are constrained (i.e., proximity to other partition, acreage, and potential dispersal corridors). Irregular shelterwood will minimize foraging habitat fragmentation, allow for the residual stem to be available for future cavity trees, and provide an age structure that could expedite potential suitable GQFH in the regenerated stand.

Thinning, irregular shelterwood, or seedtree may be used in stands of habitat within Management Unit 17 that is currently mixed pine-hardwood to promote a greater pine component. In areas where the habitat constraints mentioned above are not present, the use of shelterwood, irregular shelterwood, seedtree harvest, patch cuts, afforestation, and reforestation may all be viable options to promote a sustainable pine-hardwood forest habitat. The exact regeneration methods used will be site and habitat condition-specific based on observed site conditions and proximate location to the existing GQFH within the partition.

Existing fire lines will be maintained to contain fire and new lines will be established to protect regenerating tree species. All decisions on location, frequency, and intensity of treatments will be determined by habitat condition and needs of the RCW for foraging habitat. Natural fire breaks and temporary hand-lines will be favored to minimize the amount of artificial fire breaks installed or maintained between management units. Administrative UTV trails may be improved to prevent soil erosion and protect water quality. Improvements may include use of erosion control fabric, gravel, and small bridges.

All old field locations determined to be needed for RCW management within Management Unit 17 will be reforested in pine species (i.e., loblolly, short-leaf pine, and long-leaf pine) that best represent historical forest and site conditions and facilitate the management of the habitat for RCWs. Seedlings will be planted using either natural reseeding or manual replanting of seedlings. These same species and techniques may also be used to regenerate damaged habitats within forest openings such as those caused by southern pine beetle, ips, or storms. All habitat management activity will occur when site and species conditions are favorable for the management activity to happen and minimally impact the habitat or resource of concern. The forest management operations within RCW areas will adhere to the RCW Recovery Plan Guidelines.

### **Aquatic Management**

SMZs will be protected based on stream order and the minimums defined previously (pages 77-78). Prescribed fire will normally be allowed to burn into SMZs with site conditions (e.g., wetness), dictating burn extent into the zone. Fire will be excluded from SMZs when habitat conditions indicate undesirable impacts to regeneration, mortality of canopy trees, and increased soil erosion. Timber management may occur within the SMZs under guidelines within Mississippi's Best Management Practices for Forestry (2008), if needed to maintain the desired forest conditions.

---

### **Administrative Use Lands**

Open public and administrative roads within the unit may be maintained in a graveled state from ditch to ditch and will receive maintenance related activity throughout the year. Vehicle access into the unit will be limited to Dummy Line Road to prevent the spread of exotic species. Road maintenance, starting at the outside of the drainage ditches, will allow habitat to be maintained in the same manner as within the main forested unit. Vegetative barriers may be left along road edges to provide wildlife cover from road related disturbance and to deter road hunting activities, particularly where roads are adjacent to fields. Temporary haul roads created to facilitate removal of timber will be abandoned, possibly replanted to forest, and not maintained as a road through time. Administrative UTV access trails may need to be created to facilitate the monitoring of birds at individual cluster locations. These trails will not be highly developed but may be improved to provide year-round UTV access without damage to soil or water quality.

#### Adaptive Management Monitoring Elements:

- Conduct RCW monitoring according to the 2003 RCW Recovery Plan.
- The primary habitat response variables will be forest overstory structure and composition, forest midstory and understory structure within RCW partitions as measured by forest inventory data.
- The primary wildlife response variable will be forest breeding bird species composition and abundance using breeding landbird surveys (point counts).
- The refuge will consider herptafauna survey (according to PARC guidelines and protocol) (<http://www.parcplace.org/publications/inventory-and-monitoring-guide.html>).
- Monitor the effects of forest management activities to maintain integrity of desired species composition, habitat structure, and forest health.

---

## *Appendix H. Wilderness Review*

### **WILDERNESS REVIEW: SAM D. HAMILTON NOXUBEE NATIONAL WILDLIFE REFUGE**

#### **WILDERNESS REVIEW PROCESS**

The purpose of a wilderness review is to identify and recommend for congressional designation National Wildlife Refuge System lands and waters that merit inclusion in the National Wilderness Preservation System. Wilderness reviews are a required element of Comprehensive Conservation Plans. They are conducted in accordance with the Service's wilderness review and evaluation policy guidance (610 FW 4) and according to the refuge planning process outlined in 602 FW 1 and 3, including public involvement and National Environmental Policy Act (NEPA) compliance.

There are three phases to the wilderness review process:

- 1) **Wilderness Inventory.** The wilderness inventory identifies lands and waters that meet the minimum criteria for wilderness. These areas are called wilderness study areas (WSAs).
- 2) **Wilderness Study.** The wilderness study evaluates a range of management alternatives to determine if a WSA is suitable for wilderness designation or management under an alternate set of goals and objectives that do not involve wilderness designation. The findings of the study determine whether we will recommend an area for wilderness designation in the Comprehensive Conservation Plan.
- 3) **Wilderness Recommendation.** The recommendation phase consists of reporting recommendations for wilderness designation from the Director of the Fish and Wildlife Service through the Secretary of the Interior and the President to Congress in a wilderness study report. The study report is prepared following completion of the CCP. Congress has reserved the authority to make final decisions on wilderness designation.

This appendix summarizes the inventory and study phases of the wilderness review for the Sam D. Hamilton Noxubee National Wildlife Refuge.

A team was established for conducting a wilderness review, including refuge staff, Andrea Dunstan, Bobbi Gentry, Lori Haygood, Steven Lewis, Michelle Paduani, Steve Reagan, Paul Reynolds, Kimberly Sykes, and Natalee Yates; Bev Smith, Director of the Larry Box Environmental Education Center; and Kathy Lunceford, Ecological Services Biologist. The group met at the refuge on July 8, 2013, to gather information and conduct an inventory of the refuge's lands and waters. This process required reviewing all land acquisitions since 1974, site knowledge with existing land status maps, photographs, available land use information and road inventory data to determine if any additional refuge lands and waters met the minimum criteria for wilderness. Aerial and non-aerial photographs along with Geographic Information System

---

data were used to document the imprint of man's work, road locations, and other surface disturbances. There was a power point presentation that included maps, pictures, and descriptions of all the WSA's on the refuge. The power point presentation with photos and maps is available in the administrative record.

## **Wilderness Inventory**

The wilderness inventory consists of identifying areas that minimally meet the requirements for wilderness as defined in the Wilderness Act of 1964 (Wilderness Act). It represents a broad look at the planning area to identify WSAs.

The definition of wilderness is found in section 2(c) of the Wilderness Act: "A wilderness, in contrast with those areas where man and his works dominate the landscape, is hereby recognized as an area where the earth and its community of life are untrammeled by man, where man himself is a visitor who does not remain." In this act, an area of wilderness is further defined to mean an area of undeveloped federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions and which "(1) generally appears to have been affected primarily by the forces of nature, with the imprint of man substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) has at least five thousand acres of land or is of sufficient size as to make practicable its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic, or historic value."

## **Wilderness Study**

During the study phase, lands and waters qualifying for wilderness as a result of the inventory are studied in greater detail to analyze values (e.g., ecological, recreational, cultural, economic, and symbolic), resources (e.g., wildlife, water, vegetation, minerals, and soils), public uses, and refuge management activities within the area. The analysis includes an evaluation of whether the WSA can be effectively managed to preserve its wilderness character.

The environmental analysis addresses benefits and impacts to wilderness values and other resources under each management alternative. The study evaluates how each alternate will:

- Achieve the purposes of the Wilderness Act and the NWPS;
- Affect achieving refuge or planning unit purpose(s);
- Affect the refuge's contribution toward achieving the Refuge System mission;
- Affect maintaining and, where appropriate, restoring biological integrity, diversity, and environmental health at various landscape scales; and
- Meet other legal and policy mandates

The findings of the study help determine the WSAs suitability for management and preservation as wilderness with regard to its primary purposes as a refuge. The information, analysis, and decisions in the CCP and associated NEPA document provide the rationale for wilderness suitability determinations and the basic source of information throughout the public, executive, and legislative review processes that follow.

---

## **Wilderness Recommendation**

There is no requirement to recommend a WSA for congressional designation as wilderness. The final CCP and record of decision document the Service's determination on a WSA's suitability (or unsuitability) for wilderness and decision to recommend (or not recommend) an area for designation.

For a WSA recommended suitable for designation, additional steps will be required including preparing a wilderness study report that presents the results of the wilderness review, documentation of opportunities for public review, a copy of the final CCP, and a legislative Environmental Impact Statement (LEIS). Once these documents are prepared, they are transmitted from the Service Director to the Secretary of the Interior to the President, and ultimately to Congress for approval.

WSAs recommended as suitable for wilderness designation are managed according to the management direction provided in the final CCP. Recommended wilderness areas (RWAs) have been approved by the Director and forwarded to the Secretary for consideration. RWAs are managed to maintain their wilderness character. Proposed Wilderness Areas (PWAs) have been approved by the Secretary and forwarded to the President for consideration. PWAs are managed consistent with Service Wilderness Stewardship policy 610 FW 1-3 and sections 4.22B and C. Areas will be managed at their respective level of approval until either Congress legislatively designates the area as wilderness or the CCP is amended to modify or remove the wilderness proposal.

## **WILDERNESS INVENTORY OF Sam D. Hamilton Noxubee NWR**

The wilderness inventory is a broad look at the CCP planning area to identify WSAs. WSAs are roadless areas within the refuge boundaries that meet the minimum criteria for wilderness identified in Section 2(c) of the Wilderness Act. A WSA must meet the minimum size requirement (or be a roadless island), appear natural, and provide outstanding opportunities for solitude or primitive recreation. Other supplemental values are evaluated, but not required.

### **Proposed Wilderness (Fish and Wildlife Service) in 1974**

Lands that have been through a formal Wilderness Fish and Wildlife Service review and have been "proposed" to the Department of Interior Secretary for Wilderness designation are managed in the same manner as designated wilderness, so that, if they become wilderness, their Wilderness character is preserved. For the refuge, approximately 1,200 acres of seasonally flooded and timbered bottomland hardwoods were previously proposed as wilderness in 1974 (Figure 8). The wilderness study report proposed wilderness in the area bounded by the Noxubee River on the west and north, Oktoc Creek on the south, and Bluff Lake on the southeast. The area's timber and land has not been impacted by man since before the refuge was established in 1935. There is a 3-mile primitive loop foot trail in the proposed wilderness that has been periodically maintained by the Sierra Club. There also have been times when chain saws were used to clear the trail and trail markers have been put up in conflict with the Wilderness Act, and these actions are duly noted and will not continue to occur with the approval of this CCP.

Our inventory of potentially eligible lands and waters and the application of the wilderness criteria are described in the following sections.

---

## **Identification Lands of Potentially Eligible for Consideration as Wilderness**

Identification of potentially eligible lands and waters required gathering land status maps, land acquisition documents including pre-acquisition surveys where available, land use and road inventory data, and aerial imagery of existing refuge tracts. First-hand knowledge by staff of the current and past history of tracts was also important in refining the analysis. All lands currently owned by the refuge were evaluated but especially roadless and undeveloped areas. "Roadless" refers to the absence of improved roads suitable and maintained for public travel by means of motorized vehicles primarily intended for highway use. Additionally, only lands and waters currently owned by the Service in fee-title were included in the evaluation. These lands and waters are included in three WSAs, all contiguous with the existing Wilderness Area. WSAs are described in greater detail in the Wilderness Study section of this review.

The Sam D. Hamilton Noxubee NWR Wilderness Inventory was divided into two separate and distinct steps. In step one, we inventoried all federal lands within the Sam D. Hamilton Noxubee NWR that were not proposed for Wilderness designation in 1974, including those lands that have been acquired. In step two, we inventoried the lands within Sam D. Hamilton Noxubee NWR that were proposed for Wilderness designation in 1974. These fee-title lands were initially assessed based on the size criteria.

The lands inventoried in step one included all refuge lands except those already in the proposed wilderness area and totaled 47,019 acres. The areas that were considered were Management Units 1, 2 and 3 located north of Highway 25 (Figure 5), Management Unit 16 in the Bevill's Hill area (Figure 6), and all named river, creek, stream, and waterway streamside management zones (Figure 7). Management Units 1, 2, 3 and 16 were inventoried in 1974 and the Service evaluated these areas again in 2014 during this Wilderness Review

### **North Unit Wilderness Inventory Unit (Management Units 1, 2 and 3)**

The North Unit, consisting of approximately 4,274 acres of historically diverse forest with

bottomland hardwood, bald cypress, and pines including a few scattered parcels of upland hardwoods was used as agricultural croplands before the refuge was established (Figure 2). After being acquired by the Federal Government in 1935, the area was actively managed to encourage a mono-typical habitat of loblolly pines with open understory to increase red-cockaded woodpecker habitat. Red-cockaded woodpeckers are currently active within the area. The area will potentially continue to be actively managed to promote desired forest conditions for RCW as long as the current woodpecker clusters remain active.

**Figure 1. North Unit Cistern**

**Figure 2: North Unit 1948**

---

#### Bevill's Hill Wilderness Inventory Unit (Management Unit 16)

The Bevill's Hill area, consisting of 2,683 acres of pine with mixed upland hardwood, historically consisted of mixed pine with upland hardwood. Prior to acquisition by the Federal Government, the area was actively farmed and subjected to high rates of soil erosion (Figures 3 & 4). Following manual and natural reforestation, the area now sustains forests that have received active timber management in the form of tree harvest and chemical control of hardwood plant growth. The area contains a developed hiking trail and parking area. An approximate 5-acre borrow pit remains within the unit and was active as recently as 2006.

Figure 3: Bevill's Hill area active farming and bare soil.

Figure 4: Bevill's Hill soil erosion.

#### Streamside Management Zones Wilderness Inventory Units

Streamside management zones (Figure 7) are buffers around all rivers, creeks, and waterways found on the refuge. These lands total approximately 1,700 acres. These multiple tracts of land were not considered under previous wilderness reviews. Streamside management zones reach throughout the refuge and include a wide range of habitats. Roads and other man-made features are incorporated within these buffer areas.

#### **Evaluation of Size Criteria**

An inventory unit meets the size criteria for a WSA if any one of the following standards applies (610 FW 4.8):

- An area with over 5,000 contiguous acres. State and private lands are not included in making this acreage determination.

- 
- A roadless island of any size. A roadless island is defined as an area surrounded by permanent waters or that is markedly distinguished from the surrounding lands by topographical or ecological features.
  - An area of less than 5,000 contiguous federal acres that is of sufficient size as to make practicable its preservation and use in an unimpaired condition, and of a size suitable for wilderness management.
  - An area of less than 5,000 contiguous federal acres that is contiguous with a designated wilderness, recommended wilderness, or area under wilderness review by another federal wilderness managing agency such as the Forest Service, National Park Service, or Bureau of Land Management.

## *1. Discussion*

The following three areas were identified for further evaluation as potential WSAs:

- (1) 4,274 acres in the North unit located above Highway 25 (Figure 5),
- (2) 2,683 acres in the Bevill's Hill area (Figure 6), and
- (3) 1,700 acres of combined streamside management zones (Figure 7).

## *2. Conclusion*

The North Unit has one administrative access road bisecting the unit; part of the road is built over a man-made levee used in the creation of a 3-acre pond; a bridge allows passage over the Chinchahoma Creek; and the area is less than 5,000 acres in total size. This area does not fall within either of these size designations because the use will still not be unimpaired and practical.

The Bevill's Hill Unit has a refuge public access road and a county maintained road (Clearman Road) bisecting the area and it is less than 5,000 acres. This area does not fall within either of the size designations mentioned above because use of the area will still not be unimpaired, practical, or contiguous.

No single streamside management zone is larger than 5,000 acres, but together the areas represent significant amounts of land (1,700 acres) and are distributed throughout the refuge. This area does not fall within either of the size designations mentioned above because use of the area will still not be unimpaired, practical, or contiguous.

## **Evaluation of the Naturalness Criteria**

To qualify as a WSA, an area must meet the naturalness criterion (610 FW 4.9). Section 2(c) of the Wilderness Act defines wilderness as an area that "...generally appears to have been affected primarily by the forces of nature with the imprint of man's work substantially unnoticeable." The area must appear "natural" to the average visitor rather than "pristine." The presence of ecologically intact, historic landscape conditions is not required. An area may include some man-made features and human impacts provided they are substantially unnoticeable in the unit overall. In the inventory phase, the naturalness evaluation focuses on the existing physical impacts of refuge management activities, refuge uses, or human-caused hazards. At this stage, we do not disqualify an area from further study solely on the basis of established or proposed activities or uses that require the use of temporary roads, motor

---

vehicles, motorized equipment, motorboats, mechanical transport, landing of aircraft, structures, and installations generally prohibited in designated wilderness. In addition, an area may not be considered unnatural in appearance solely on the basis of "sights and sounds" of human impacts and activities outside the boundary of the unit.

### *1. Discussion and Conclusion*

In the North Unit the presence of humans is notable in a variety of ways including numerous fire lines used in conducting prescribed fire, stands of forest that have undergone timber harvest, a man-made levee on which the road was established and which a pond was created, and other cultural artifacts including old home sites and cisterns (Figure 2). There remains a good opportunity for solitude or primitive and unconfined recreation based on the location of the area relative to the more actively managed areas of the refuge, but because there is a possibility of active management to occur in the area, the team found that the naturalness will not be preserved.

Bevill's Hill Unit has many management actions that have been conducted in the past and may contribute to the area being perceived as less natural. Overtime, the predominantly pine area has been treated with some prescribed fire but not enough to control hardwood midstory. Chemical hardwood control has been used on approximately 300 acres recently used to control hardwood growth, but was a secondary benefit from spraying targeted at controlling bi-color lespedeza. Active forest management has been conducted at the stand level. These past management actions may not give the area a natural appeal to the average visitor now or in the future.

The steamside management zone units are frequently bisected by roads with bridges spanning waterways. Previously established fire lines and ditches can be found throughout these areas. Some areas have been subjected to low intensity timber harvest. Because of these past management activities, these areas may not be perceived as natural to the average visitor.

### **Evaluation of Outstanding Opportunities for Solitude or Primitive and Unconfined Recreation Criteria**

In addition to meeting the size and naturalness criteria to qualify as WSA, an area must provide outstanding opportunities for solitude or primitive recreation (610 FW 4.10). The area does not have to possess outstanding opportunities for both solitude and primitive recreation, and does not need to have outstanding opportunities on every acre. Further, an area does not have to be open to public use and access to qualify under these criteria. Congress has designated a number of Refuge System Wilderness Areas that are closed to public access to protect ecological resource values.

Opportunity for solitude refers to the ability of a visitor to be alone and secluded from other visitors in the area. Primitive and unconfined recreation means non-motorized, dispersed outdoor recreation activities that do not require developed facilities or mechanical transport. These primitive recreation activities may provide opportunities to experience challenge and risk, self-reliance, and adventure.

These two opportunity "elements" are not well defined by the Wilderness Act but in most cases can be expected to occur together. However, an outstanding opportunity for solitude may be present in an area offering only limited primitive recreation potential. Conversely, an area may be so attractive for recreation use that experiencing solitude is not an option.

### *1. Discussion and Conclusion*

---

The North Unit is currently possesses ample opportunities for solitude or primitive and unconfined recreation, especially in the more interior areas. While not far from human development, the area has the potential to provide visitors with an outstanding wilderness experience. There is a great potential for primitive recreation activities that provide opportunities to experience challenge and risk, self-reliance, and adventure.

The Bevill's Hill Unit provides a good opportunity for solitude or primitive and unconfined recreation due to the remoteness compared to the rest of the acres on the refuge. It is very attractive for recreation use because of the difference in topography and habitat.

The streamside management zone units do not provide a really good opportunity for solitude or primitive and unconfined recreation, because they are small areas strung between other areas that are heavily used for other purposes.

### **Supplemental Values**

Supplemental values are defined by the Wilderness Act as "ecological, geological, or other features of scientific, educational, scenic, or historic value." These values are not required for consideration as a WSA but their presence is documented.

#### *1. Discussion and Conclusion*

The North Unit does not have any notable supplemental value.

The diversity of the habitats found in the Bevill's Hill Unit compared to the rest of the refuge is unique in its topography and habitat type. The current habitat consists of loblolly, shortleaf, longleaf pine, and upland hardwood forest with numerous stream side management zones extending down along the unit's topographic draws with more than 200 feet elevation change. The upland hardwood component of this management unit is comprised of primarily white oak, red oak, and mixed pine. The upland hardwood as described is an important and unique ecosystem on the refuge and surrounding lands. The area also contains cultural resources including old home sites, livestock dipping troughs, and a large saw dust pile from saw mills present until the 1950s. These cultural resources are valuable to the public and the refuge as they help to preserve the history of the area.

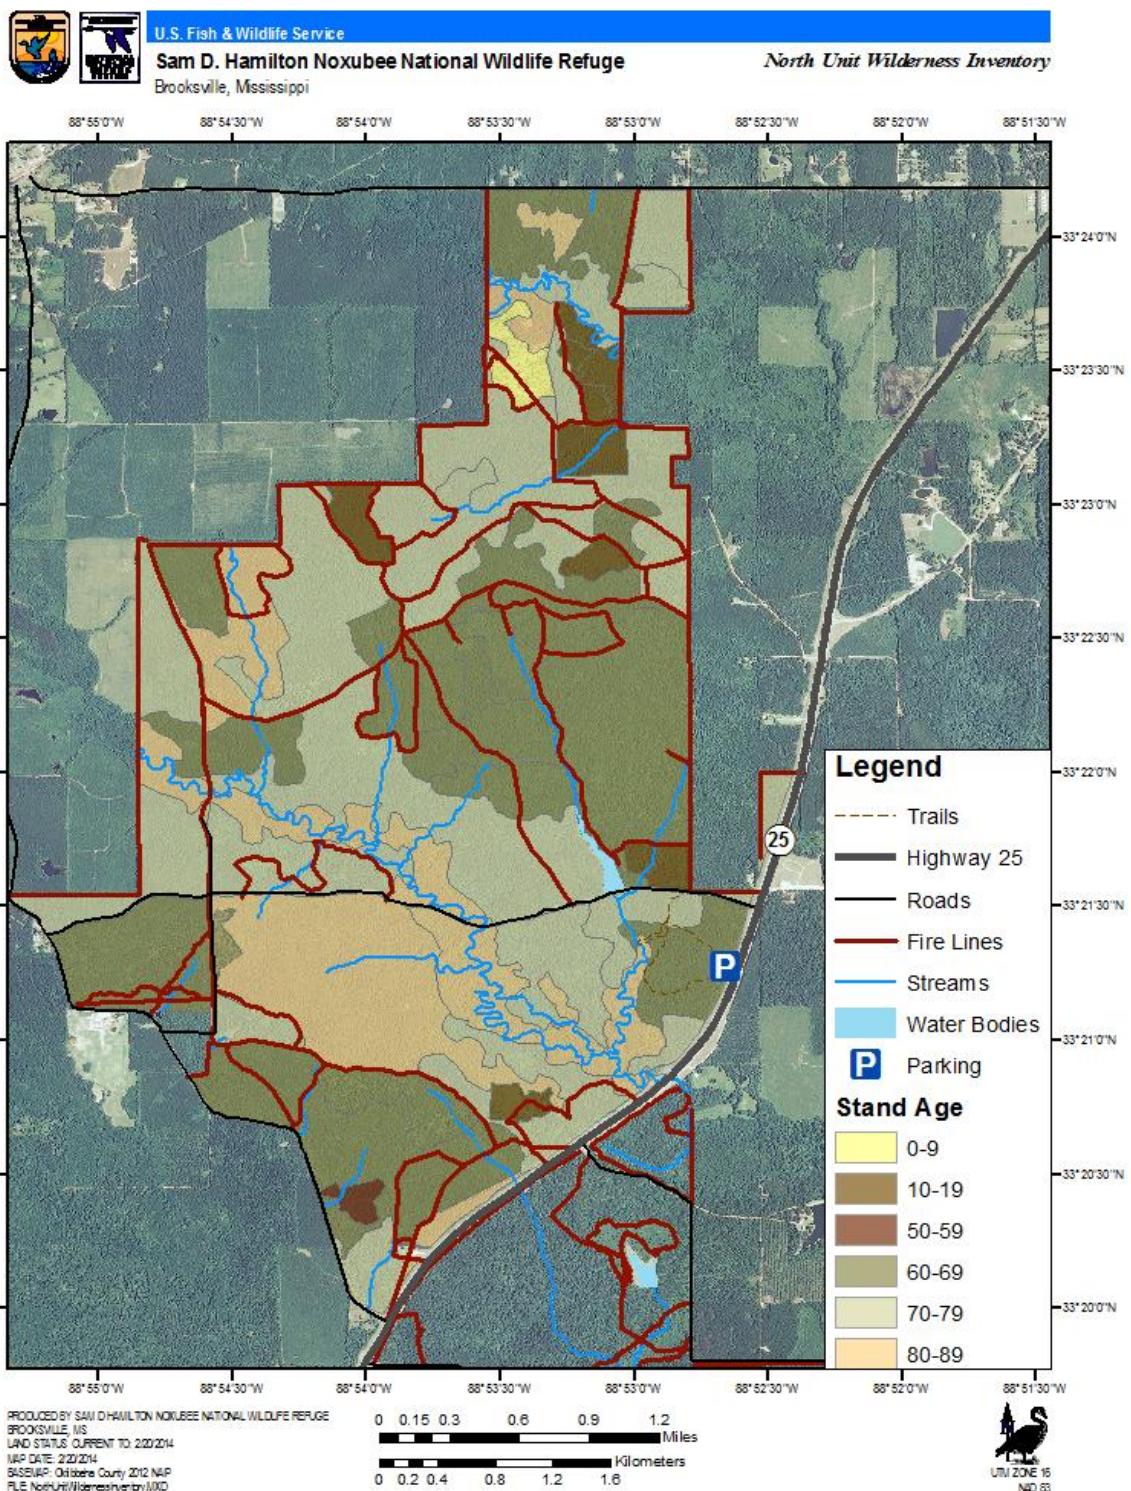

The streamside management zone units contain numerous cultural resources including saw dust piles from old timber mill sites and archaeological sites that are important to the public as well as the refuge as they help to preserve the history of the area. These areas have a special supplemental value because streamsides contain a diverse array of wildlife and habitat.

### **Summary**

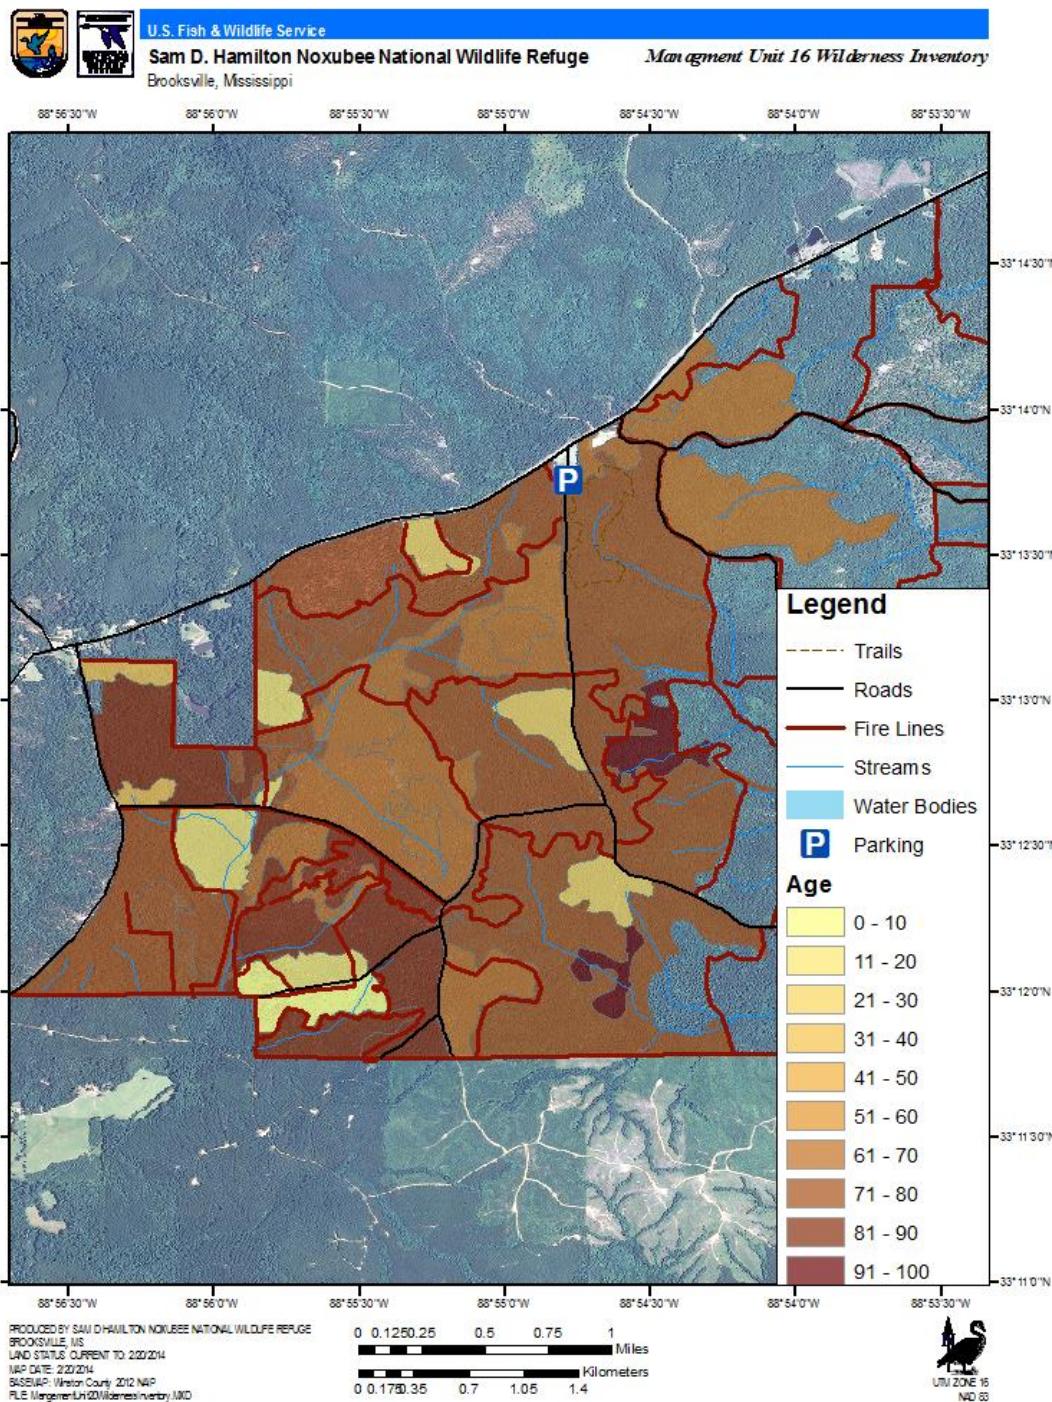

Prior to the acquisition of these lands by the Federal Government in 1935, most of the refuge was cleared and subjected to agricultural crops. The lands within the current refuge were highly eroded characteristic of bare exposed soils, deep ruts, and little wildlife. Thousands of acres were reforested yearly and a Civilian Conservation Corps (CCC) camp created numerous roads, levees, water control structures, and water bodies as part of management for wildlife. Throughout the history of the refuge, active management has played a major role on the land and its habitats. Other than the existing proposed wilderness area, the refuge lands are subjected to active management to meet the purposes for which it was established. Each area considered within this review has been impacted to differing degrees and for these reasons, the

---

Service finds all federal lands within the Sam D. Hamilton Noxubee NWR that were not proposed Wilderness in 1974 do not meet the minimum criteria as defined by the Wilderness Act and will not be considered further in this CCP for Wilderness designation. The Service will continue to manage the 1,200 acres of proposed wilderness in accordance with 610 FW 1 – 5 and will adjust management accordingly once Congress has made a final decision about designation.

## *Appendix J. Budget Requests*

The refuge's budget requests are contained in the Refuge Operating Needs System (RONS) and Service Asset and Maintenance Management System (SAMMS) databases that include a wide variety of new and maintenance refuge projects. The RONS and SAMMS lists are constantly updated and include priority projects. Contact the refuge for the most current RONS and SAMMS lists. Please refer to Chapter V, Plan Implementation, for the key budget requests associated with the proposed projects and staffing. Chapter V includes the proposed projects, which are linked to the applicable objectives, and Table 7, which identifies staff, first-year costs, and recurring costs for the outlined projects.

---

## *Appendix. K Consultation and Coordination*

This appendix summarizes the consultation and coordination that occurred in the process of identifying the issues, alternatives, and proposed alternative, which were presented in the Draft CCP/EA. It lists the meetings that were held with various agencies, organizations, and individuals who were consulted in the preparation.

The following meetings, contacts, and presentations were undertaken by the Service during the preparation of the CCP/EA:

### *CCP PLANNING TEAM*

The CCP Planning Team met several times between 2012 and 2014. It included representatives from the Service, the University of Mississippi, and the State of Mississippi. The team met as a whole to determine the priority issues, identify potential solutions or approaches (alternatives), and to develop, review and refine the CCP/EA.

- Dr. Steven Reagan, USFWS, Project Leader, Sam D. Hamilton Noxubee and Choctaw NWRs
- Kimberly Sykes, USFWS, Deputy Manager, Sam D. Hamilton Noxubee and Choctaw NWRs
- Michelle Paduani, USFWS, Natural Resource Planner
- Andrea Dunstan, USFWS, Sam D. Hamilton Noxubee NWR, Visitor Services
- Richard Campbell, USFWS, Project Leader, Private John Allen NFH
- Kathy Lunceford, USFWS, Ecological Services, Biologist
- Beverly Smith, Starkville School District, Entomologist/Naturalist
- Randy Wilson, USFWS, Migratory Birds
- Dave Godwin, MDWFP, Biologist
- Dr. James Martin, MSU, Professor

### *BIOLOGICAL REVIEW “PULSE CHECK” TEAM*

The Wildlife and Habitat Management Review Team consisted of Service staff with invited state and county agency researchers and natural resource managers. The refuge's pulse check for the biological review was conducted during January 20-22, 2010. The review summary was completed by Randy Wilson in 2010. The list below includes the people who were on this review team and their associated titles when the review was completed.

- Elizabeth Souheaver, Regional Office, Area II Refuge Supervisor
- Chuck Hunter, Regional Office, Refuges
- Janet Ertel, Regional Office, Refuges
- Randy Wilson, Jackson Field Office, Migratory Birds
- Dr. Bruce Leopold, Mississippi State University
- Dr. Don Jackson, Mississippi State University
- Dr. Jeanne Jones, Mississippi State University
- Dr. Wes Burger, Mississippi State University
- John Hodges, Consultant
- Dr. Sue Wilder, Refuge Fire Management Officer, Mississippi

- 
- Gary Pogue, West Tennessee NWR Complex
  - Gypsy Hanks, North Louisiana NWR Complex

#### *VISITOR SERVICES REVIEW TEAM (ALL FWS)*

Garry Tucker, Visitor Services and Outreach Specialist, Regional Office, Atlanta, GA

#### *CULTURAL RESOURCES REVIEW TEAM*

Rick Kanaski, FWS, Regional Archaeologist and Historic Preservation Officer, Savannah Coastal Refuges

#### *WILDERNESS REVIEW TEAM*

The wilderness review team met at the refuge on July 8, 2013, to gather information and conduct an inventory of the refuge's lands and waters. This process required reviewing all land acquisitions since 1974, site knowledge with existing land status maps, photographs, available land use information, and road inventory data, to determine if any additional refuge lands and waters met the minimum criteria for wilderness. Aerial and non-aerial photographs were used to document the imprint of man's work, road locations, and other surface disturbances. The power point presentation with photos and maps is available in the administrative record.

## *Appendix M. Finding of No Significant Impact (FONSI)*

### **Introduction**

The U.S. Fish and Wildlife Service proposes to protect and manage certain fish and wildlife resources in Oktibbeha, Winston, and Noxubee Counties, Mississippi, through the Sam D. Hamilton Noxubee National Wildlife Refuge (Refuge). An Environmental Assessment has been prepared to inform the public of the possible environmental consequences of implementing the Comprehensive Conservation Plan for Sam D. Hamilton Noxubee National Wildlife Refuge. A description of the alternatives, the rationale for selecting the preferred alternative, the environmental effects of the preferred alternative, the potential adverse effects of the action, and a declaration concerning the factors determining the significance of effects, in compliance with the National Environmental Policy Act of 1969, are outlined below. The supporting information can be found in the Environmental Assessment, Section B of the Draft Comprehensive Conservation Plan.

### **Alternatives**

In developing the Comprehensive Conservation Plan for Sam D. Hamilton Noxubee National Wildlife Refuge, the Fish and Wildlife Service evaluated three alternatives:

The Service adopted Alternative C, the “Preferred Alternative,” as the comprehensive conservation plan for guiding the direction of the Refuge for the next 15 years. The overriding concern reflected in this plan is that wildlife conservation assumes first priority in refuge management; wildlife-dependant recreational uses are allowed if they are compatible with wildlife conservation. Wildlife-dependent recreation uses (hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation) will be emphasized and encouraged.

#### *Alternative A. No Action*

This alternative is referred to as our “No Action” or “Current Management” alternative, as required by the National Environmental Policy Act (NEPA). Under this alternative, no major changes to biological, public use, and administrative management practices would occur from their current levels.

#### *Alternative B. Focus on Waterfowl and Federally Listed Species*

This management scheme places priority on the federally listed species and waterfowl which are integral to the refuge’s purpose. This alternative emphasizes active habitat management actions that would benefit the endangered red-cockaded woodpecker and waterfowl. Visitor service programs and facilities in support of the six priority public uses (e.g., hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation) would be much reduced below those levels for Alternatives A and C. Non-wildlife-dependent public uses would be phased out.

---

### **Alternative C. Focus on Wildlife, Habitat Diversity, and Experiencing Nature**

The preferred alternative, Alternative C, is considered to be the most effective management action for meeting the purposes of the Refuge by managing refuge resources to optimize native wildlife populations and habitats under a balanced and integrated approach not only for federally listed species (RCW) and migratory birds, but also for other native species such as white-tailed deer, wild turkey, Northern bobwhite, paddlefish, and forest breeding birds. This alternative also provides opportunities for the six priority public uses (e.g., hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation) and other wildlife-dependent activities found appropriate and compatible with the purposes for which the refuge was established.

#### **Selection Rationale**

Alternative C is selected for implementation because it directs the development of programs to best achieve the Refuge purpose and goals; emphasizes habitat management based on historic habitat conditions as guided by law (Improvement Act) and policy (601 FW 3) for the Refuge System. Management will be implemented for the conservation of a diverse bottomland hardwood habitat to benefit migratory birds and resident wildlife. Upland habitats will be maintained within their historic habitat conditions including mimicking the natural fire regime and disturbances needed to benefit migratory birds, red-cockaded woodpeckers, and resident wildlife. A focused effort will be made to prevent, reduce, and eradicate invasive species threatening the biological integrity of the refuge. Monitoring and reconnaissance of a variety of wildlife species, ranging from reptiles and amphibians to butterflies to species of concern, will be used to assess and practice adaptive management. Cooperative projects will be prioritized based on ability to meet management objectives outlined in the CCP, or to meet refuge purpose and conducted with universities and other agencies and individuals to provide biological information to be used in management decision-making. When compatible, the wildlife-dependent recreational opportunities for hunting, fishing, wildlife observation, wildlife photography, and environmental education and interpretation will be provided, and in some instances enhanced, while achieving the refuge purposes. It provides the best mix of program elements to achieve desired long-term conditions.

Under this alternative, all lands under the management and direction of the Refuge will be protected, maintained, and enhanced to best achieve national, ecosystem, and refuge-specific goals and objectives within anticipated funding and staffing levels. In addition, the action positively addresses significant issues and concerns expressed by the public.

#### **Environmental Effects**

Implementation of the Service's management action is expected to result in environmental, social, and economic effects as outlined in the comprehensive conservation plan. Habitat management, population management, land conservation, and visitor service management activities on Sam D. Hamilton Noxubee National Wildlife Refuge would result in expanding resource management for diversity while enhancing wildlife management and recreation opportunities. Implementation of Alternative C is anticipated to result in net positive environmental benefits.

These effects are detailed as follows:

---

Active habitat management, using a variety of methods including silvicultural and integrated exotic, invasive, nuisance, and pest management, would improve habitats for migratory birds, federally listed species, native wildlife, habitat diversity, and experiencing nature. In bottomland hardwoods, waterfowl and forest breeding bird populations would be enhanced through improved nesting, brooding, and foraging opportunities. Forests within the bottomland hardwoods would be managed to reflect historic habitat conditions and produce multi-layered canopies and increased midstory development to create a natural floristic diversity within the forest midstory and understory. Additional benefits would be provided to over-wintering bird populations through an increase in foraging and thermal cover opportunities. In pine forests, active habitat manipulations used to benefit RCWs would include silvicultural practices; raking; integrated exotic, nuisance, and pest management; bird banding; creation of new artificial cavities; maintenance of suitable cavities; use of restrictor plates; snake exclusion devices; predator and kleptoparasite control; and bark-shaving, which together would increase RCW productivity on the refuge. Mature pine forests characterized by well-spaced pines, an open midstory and understory, and dense ground cover of grasses and forbs would also provide desired habitat for grassland species and migratory birds, such as Bachman's sparrow, and native species, such as quail and turkey. The silvicultural and integrated exotic, invasive, nuisance, and pest management techniques implemented for RCWs on historic pine areas would benefit other species adapted to fire ecology. Areas of the refuge currently unoccupied by RCW and being managed in an attempt to produce habitat for RCWs, but that do not reflect historical habitat conditions of a pine forest, would be allowed to return to the habitat type most reflective of historical habitat conditions. Areas that reflect the historical pine habitat condition of pine would be managed for that type and, if applicable, for the benefit of RCWs.

The refuge would collect a wider range of scientifically based wildlife population information that contributes to good adaptive management. The refuge would continue monitoring RCWs and make an effort to monitor waterfowl food production within moist-soil areas, forest breeding birds using point counts, paddlefish reproduction in Noxubee River and at Bluff Lake spillway, fish species diversity and health within Loakfoma and Bluff lakes, effects of silviculture, and integrated exotic, invasive, nuisance, and pest management within all habitats, and wildlife habitat quality. The refuge would also provide increased management, reconnaissance, and surveying and monitoring for the benefit of resident wildlife species, such as deer, turkey, quail, amphibians, reptiles, and invertebrates as additional resources become available (e.g., funding, grants, staffing, volunteers, or partnerships).

The Service would manage waters and wetlands with existing water management structures to provide waterfowl food plants while maintaining balanced fisheries. The refuge would provide ample feeding opportunities for waterfowl through the possible combination of managed moist-soil plants within the lakes, flooded bottomland hardwoods, and seasonally flooded GTRs along with planted agricultural crops within the Management Unit-10. Enhanced breeding waterfowl nesting opportunities would also be provided by protecting natural cavities, and providing strategically placed nest boxes. Waterfowl broods survival would be enhanced by managing scrub/shrub habitat along lake edges. The refuge would continue to participate in the wood duck banding program to meet the refuge quota as assigned by National Migratory Bird Program. Public access would be allowed throughout the refuge, but limited or no human access would exist in areas important to migratory birds and their critical life cycle stages. Moist-soil wetlands would be potentially disked, planted, and flooded as necessary to provide food and habitat conditions for wintering waterfowl. Levels in all GTRs would be managed so no more than two GTRs would be flooded habitat for wintering waterfowl yearly and no one GTR artificially flooded more than twice every five years. Extended dry periods within the GTRs

---

would ensure forest species diversity and structure improved to match those of the surrounding forest of similar type.

To help ensure consistent recreational fisheries without impacting waterfowl or wood stork management, the refuge would create deep water habitat in Bluff Lake to ensure consistency in recreational fisheries resources (i.e., crappie, bass, and sunfish). Excess soil from the creation of the deep water habitat would be used to create islands within the lake to serve as future bird rookery sites made up of bald cypress. The refuge would find opportunities to redesign existing water control structures on Bluff Lake and the Oktoc River drainage and improve fish passage from Noxubee River to other upstream areas of the lake to positively benefit paddlefish and other aquatic species.

Almost all existing old field sites would be managed to produce habitat conditions reflective of historic forest conditions. A limited number of existing old fields in areas not designated for RCWs would be managed for the benefit of native grassland species. Morgan Hill Prairie Demonstration Area would be reduced by more than 50 percent to only the 31 acres located at the north end of the existing open area. Fields not maintained would be restored to historic species composition. No new field sites would be created as the improved forest management for RCW should provide collateral benefits for native grassland species. All existing RNA designations would be eliminated and the lands managed within the surrounding habitats to reflect historic forest conditions.

A comprehensive, refuge-wide survey of archaeological sites as well as individual cultural resource surveys for specific projects or sites would be conducted. Partnerships would be developed with other agencies and cultural groups to seek ideas and the means to improve management of cultural resources. Law enforcement for visitor safety, resource protection, and compliance with refuge regulation would increase. Archaeological and historical sites would continue to be protected.

Partnerships and community involvement would be key methods for protecting the ecology and biological function of the landscape. Development of easements and land acquisition would be a tool used to provide land protection. Efforts to acquire private lands from willing sellers remaining within the existing approved acquisition boundary (AAB) would continue to be made. Expanding the refuge's AAB would only occur after 90 percent of the obtainable lands within the current AAB have been acquired or additional lands are needed to meet the purposes for which the refuge was established.

The visitor services programs would be increased and made more readily accessible for users with disabilities as manageable by funding and staffing. Fishing from designated bank areas of the Bluff and Loakfoma lakes would be allowed year-round. Deer hunting opportunities would be increased by expanding areas and seasons. Other wildlife-dependent uses and their supporting facilities would be maintained and enhanced as resources become available. Wildlife observation and photography opportunities would increase through the addition of trails, additional signs, and increased maintenance of existing facilities. A "Connecting People with Nature" area would be designated around the visitor center and developed with new trails, kiosks, and other visitor amenities.

The refuge would improve or add facilities and equipment as funding allows including: vehicle fleet; computer and communication systems; and refuge entrance roads, buildings, structures, trails, and signs. The Service would increase staff and funding to better manage the refuge. Good communication with partners would continue and be improved. The refuge would

---

continue with the existing fee program, adding a refuge public use fee and continuing the administrative fees for quota white-tailed deer and quota waterfowl hunting.

## **Potential Adverse Effects and Mitigation Measures**

### *Wildlife Disturbance*

Disturbance to wildlife at some level is an unavoidable consequence of any public use program, regardless of the activity involved. Obviously, some activities innately have the potential to be more disturbing than others. The management actions to be implemented have been carefully planned to avoid unacceptable levels of impact.

As currently proposed, the known and anticipated levels of disturbance of the management action are considered minimal and well within the tolerance level of known wildlife species and populations present in the area. Implementation of the public use program would take place through carefully controlled time and space zoning, establishment of protection zones around key sites, closures of all-terrain vehicle trails, and routing of roads and trails to avoid direct contact with sensitive areas, such as nesting bird habitat, etc. All hunting activities (season lengths, bag limits, number of hunters) would be conducted within the constraints of sound biological principles and refuge-specific regulations established to restrict illegal or non-conforming activities. Monitoring activities through wildlife inventories and assessments of public use levels and activities would be utilized, and public use programs would be adjusted as needed to limit disturbance.

### *User Group Conflicts*

As public use levels expand across time, some conflicts between user groups may occur. Programs would be adjusted, as needed, to eliminate or minimize these problems and provide quality wildlife-dependent recreational opportunities. Experience has proven that time and space zonings, such as establishment of separate use areas, use periods, and restricting numbers of users, are effective tools in eliminating conflicts between user groups.

### *Effects on Adjacent Landowners*

Implementation of the management action would not impact adjacent or in-holding landowners. Essential access to private property would be allowed through issuance of special use permits. Future land acquisition would occur on a willing-seller basis only, at fair market values within the approved acquisition boundary. Lands are acquired through a combination of fee title purchases and/or donations and less-than-fee title interests (e.g., conservation easements, cooperative agreements) from willing sellers. Funds for the acquisition of lands within the approved acquisition boundary would likely come from the Land and Water Conservation Fund or the Migratory Bird Conservation Act. The management action contains neither provisions nor proposals to pursue off-refuge stream bank riparian zone protection measures (e.g., fencing) other than on a volunteer/partnership basis.

## **Land Ownership and Site Development**

Proposed acquisition efforts by the Service would not result in changes in land and recreational use patterns, since all uses on national wildlife refuges must meet compatibility standards. Land ownership by the Service precludes any future economic development by the private

---

sector. Potential development of access roads, dikes, control structures, and visitor parking areas could lead to minor short-term negative impacts on plants, soil, and some wildlife species. When site development activities are proposed, each activity will be given the appropriate National Environmental Policy Act consideration during pre-construction planning. At that time, any required mitigation activities will be incorporated into the specific project to reduce the level of impacts to the human environment and to protect fish and wildlife and their habitats.

As indicated earlier, one of the direct effects of site development is increased public use; this increased use may lead to littering, noise, and vehicle traffic. While funding and personnel resources will be allocated to minimize these effects, such allocations make these resources unavailable for other programs.

The management action is not expected to have significant adverse effects on wetlands and floodplains, pursuant to Executive Orders 11990 and 11988.

## **Coordination**

The management action has been thoroughly coordinated with all interested and/or affected parties. Parties contacted include:

All affected landowners  
Congressional representatives  
Governor of Mississippi  
Mississippi Department of Wildlife, Fisheries, and Parks  
Mississippi State Historic Preservation Officer  
Mississippi State University  
Chickasaw Nation  
Mississippi Band of Choctaws  
U.S. Forest Service  
Local community officials  
Interested citizens  
Conservation organizations  
Starkville Audubon Society  
Starkville School District

## **Findings**

It is my determination that the management action does not constitute a major federal action significantly affecting the quality of the human environment under the meaning of Section 102(2)(c) of the National Environmental Policy Act of 1969 (as amended). As such, an environmental impact statement is not required. This determination is based on the following factors (40 C.F.R. 1508.27), as addressed in the Environmental Assessment of the Draft Comprehensive Conservation Plan for Sam D. Hamilton Noxubee National Wildlife Refuge:

1. Both beneficial and adverse effects have been considered and this action will not have a significant effect on the human environment. (Environmental Assessment, page 127, 186, 225).
2. The actions will not have a significant effect on public health and safety. (Environmental Assessment, page 204).

- 
3. The project will not significantly affect any unique characteristics of the geographic area such as proximity to historical or cultural resources, wild and scenic rivers, or ecologically critical areas. (Environmental Assessment, page 203).
  4. The effects on the quality of the human environment are not likely to be highly controversial. (Environmental Assessment, page 201).
  5. The actions do not involve highly uncertain, unique, or unknown environmental risks to the human environment. (Environmental Assessment, page 204).
  6. The actions will not establish a precedent for future actions with significant effects nor do they represent a decision in principle about a future consideration. (Environmental Assessment, page 220).
  7. There will be no cumulatively significant impacts on the environment. Cumulative impacts have been analyzed with consideration of other similar activities on adjacent lands, in past action, and in foreseeable future actions. (Environmental Assessment, page 220).
  8. The actions will not significantly affect any site listed in, or eligible for listing in, the National Register of Historic Places, nor will they cause loss or destruction of significant scientific, cultural, or historic resources. (Environmental Assessment, page 211).
  9. The actions are not likely to adversely affect threatened or endangered species, or their habitats. (Environmental Assessment, page 206, 210).
  10. The actions will not lead to a violation of federal, state, or local laws imposed for the protection of the environment. (Environmental Assessment, page 201).
